CULTURAL RESOURCES CONSULTATION

Cultural Resources Consultation Log

Redding Rancheria Fee-to-Trust and Casino Project

Tribe	Phone number	First Name	Last Name	Title	Letter	Phone Call	Results/Information/Notes
Ajumawi Band	(530) 917-9687	Mary	Mike	Cultural Resource Representative	2/24/2016	3/4/2016	Wrong number
Aporige Band, Pit River Indians	(530) 249-6678	Everado	Dela Torre		2/24/2016	3/4/2016	Electronic msg - voice mailbox not set up.
Atsuge Band, Pit River Indians	(530) 410-4786	Bill	George		2/24/2016	3/4/2016	No comment - not their territory.
Illmawi Band, Pit River Indian Tribe	(916) 956-3576	Suntana	Sanchez		2/24/2016	3/4/2016	Number no longer in service.
Itsatawi Band	(530) 410-4800	Debbie	Rouse	Cultural Resource Representative	2/24/2016	3/4/2016	Left message
Madesi Band	(209) 597-7469	Brandon	Harrison	Cultural Resource Representative	2/24/2016	3/4/2016	Wrong number
Nor-Rel-Muk Nation	(530) 623-4940	Marilyn	Delgado	Chairperson	2/24/2016	3/4/2016	Left message
Pit River Tribe of California	(530) 335-5421	Morning Star	Gali	THPO	2/24/2016	3/4/2016	Left message
Pit River Tribe of California	(530) 335-5421	Mickey	Gemmill	Chairperson	2/24/2016	3/4/2016	Left message
Quartz Valley Indian Community	(530) 468-5907	Harold	Bennett	Chairperson	2/24/2016	3/4/2016	Left message
Redding Rancheria	(530) 225-8979	Jason	Hart	Chairperson	2/24/2016		Provided backhoe/monitoring for XPI testing
Redding Rancheria	(530) 242-4543	James	Hayward	Cultural Resource Representative	2/24/2016		
United Tribe of Northern Calif., Inc., Wintu, Wintun, Wintoon	(530) 275-1915	Gloria	Gomes	Chairperson	2/24/2016	3/4/2016	Not happy about the politics of it, no comment on resources.
Winnemem Wintu Tribe	none given	Caleen	Sisk-Franco	Chairperson	2/24/2016	3/4/2016	No phone number
Wintu Tribe of Northern California	530-605-1726	Kelli	Hayward		2/24/2016	3/4/2016	
Wintu Tribe of Northern California		Greg	Bergin			4/18/16, 4/25/16	Received an email from Mr. Burgin on 4/10/16 saying he has knowledge of cultural resources within the area. Received a voicemail from Greg Burgin on April 18 asking about monitors at the Strawberry Fields site; AES replied leaving a VM saying that Redding Rancheria was monitoring the excavations. AES called on 4/25 to follow up, and spoke to him. Mr. Bergin stated that he's concerned about development in the area, which is culturally significant.
Wintu Tribe of Northern California		Greg	Bergin			4/28/2016	Mr. Bergin left a VM saying that he's been speaking with Bob Burns, who claims that the site we've been working at was previously recorded and asking that the work there be monitored by the Wintu Tribe, as well as informing AES that he (Mr. Burgin) had contacted the NAHC.
Native American Heritage Commission		Katie	Sanchez			4/28/2016	Received a call from the NAHC, asking about the project and spoke with Katie Sanchez, who asked about the background/details of what is going on. I gave her the background, including 2007 survey, 3/16 backhoe testing, 4/16 Phase II work. I explained that Bob Burns had visited during the backhoe work and stated that there was a known site, recorded in the 1950s, but that no information about the site had come from the NEIC record search. I confirmed for Ms. Sanchez that the property is privately owned by a Federally recognized tribe, that the archaeological program there has been completed, and that the BIA is fully aware of activities on the site; she asked for a BIA contact and I gave her Dan Hall's name. She is going to get in touch with Mr. Bergin to follow up.
Wintu Tribe of Northern California		Lori	Light	Cultural Resource Manager		3/30/2017	Received a call from Lori Light asking about monitoring, status of fieldwork at Redding, stated that it is Wintu territory, and so Wintu should be monitors. Also asked for copies of CR reports and EIS.

EXECUTIVE SUMMARY

Kimley-Horn was retained by Analytical Environmental Services (AES) to prepare a traffic impact study in support of an Environmental Impact Statement (EIS) for the Redding Rancheria Casino Project (Proposed Project) located in Shasta County, California.

The Project consists of a new casino and resort, including an approximately 69,515 square foot casino, 250-room hotel, an event/convention center, and a retail center. The project site, also referred to as the Strawberry Fields Site, is located in the southwest quadrant of the Interstate 5 (I-5) interchange with South Bonnyview Road. While the I-5/South Bonnyview Road interchange is located within the City of Redding's jurisdiction, the project site is located farther south, within unincorporated Shasta County.

As part of the project, six total development alternatives (four of which are on the project site, two of which are located off site) were evaluated. The development alternatives evaluated and their respective project sites are as follows:

Strawberry Fields Site:

- Alternative A: Proposed Project
- Alternative B: Proposed Project with No Retail Alternative
- Alternative C: Reduced Intensity Alternative
- Alternative D: Non-Gaming Alternative

Anderson Site:

- Alternative E: Anderson Site Alternative (City of Anderson)

Win River Casino Site:

- Alternative F: Expansion of the Existing Win River Casino Resort

In addition, three project access options were evaluated for each development alternative on the Strawberry Fields Site. The access options are listed below:

- North Access Only – access to South Bonnyview Road via Bechelli Lane
- North and South Access – access to South Bonnyview Road via Bechelli Lane and access to Smith Road via a new connecting roadway (overpass only at Smith Road)
- South Access Only – access to Smith Road via a new connecting roadway and a new I-5 Interchange at Smith Road

The traffic study was completed for the following scenarios:

- Existing (2016) Conditions
- Opening Year (2025) Conditions
- Opening Year (2025) plus Proposed Project Conditions
- Cumulative (2040) Conditions
- Cumulative (2040) plus Proposed Project Conditions

Significant findings of this study include:

- Several intersections, primarily in and around the South Bonnyview Road/I-5 interchange, operate unacceptably with the addition of the proposed project for various study scenarios and access options. Each impact can be mitigated to be ***less than significant***.

INTRODUCTION

Kimley-Horn was retained by Analytical Environmental Services (AES) to prepare a traffic impact study in support of an Environmental Impact Statement (EIS) for the Redding Rancheria Casino Project (Proposed Project), located in Shasta County, California. The purpose of this study is to address the traffic and transportation effects of the Proposed Project.

Project Description

The Project consists of a new casino and resort, including an approximately 69,515 square foot casino, 250-room hotel, an event/convention center, a retail center, as well as associated parking and infrastructure. The Strawberry Fields Site is located in the southwest quadrant of the Interstate 5 (I-5) interchange with South Bonnyview Road.

Strawberry Fields Site Development Alternatives

As part of the project, four development alternatives at the Strawberry Fields Site were evaluated. The development alternatives evaluated are as follows:

- Alternative A: Proposed Project
- Alternative B: Proposed Project with No Retail Alternative
- Alternative C: Reduced Intensity Alternative
- Alternative D: Non-Gaming Alternative

Strawberry Fields Site Access Alternatives

As part of the project, three project access options were evaluated for each development alternative on the Strawberry Fields Site. The access options evaluated are listed below:

- North Access Only (Option 1) – access to South Bonnyview Road via Bechelli Lane
- North and South Access (Option 2) – access to South Bonnyview Road via Bechelli Lane and access to Smith Road via a new connecting roadway (overpass only at Smith Road)
- South Access Only (Option 3) – access to Smith Road via a new connecting roadway and a new I-5 Interchange at Smith Road

Site Alternatives

In addition to the alternatives listed above, two additional site alternatives were evaluated. These additional alternatives are as follows:

- Alternative E: Anderson Site Alternative (City of Anderson)
- Alternative F: Expansion of the Existing Win River Casino Resort

Study Methodology

This traffic study was based on relevant information from the Shasta County General Plan (amended September 2004), the City of Redding General Plan Transportation Element (adopted October 2000) and Caltrans.

Development Conditions

The traffic study was based on the following study scenarios:

- **Existing (2016) Conditions**
Evaluates current traffic counts, existing roadway geometry/traffic control, and existing development conditions.
- **Opening Year (2025) Conditions**
Evaluates year 2025 traffic volumes. Volumes for intersections #1-9 were taken directly from the 2017 *River Crossing Marketplace Specific Plan Traffic Impact Analysis Report*¹ Year 2020 Plus Project Conditions volumes². Volumes for intersections #10-23 were developed by linearly interpolating between existing and 2040 traffic volumes. The scenario assumes existing roadway geometry/traffic control.
- **Opening Year (2025) plus Proposed Project Conditions**
Evaluates year 2025 traffic volumes and traffic generated by the project.
- **Cumulative (2040) Conditions**
Volumes for intersections #1-9 were taken directly from the 2017 *River Crossing Marketplace Specific Plan Traffic Impact Analysis Report* Year 2040 Plus Project Conditions volumes². Volumes for intersections #10-23 were developed using the Shasta County Regional Travel Demand Model (SCRTDF)³. The scenario assumes existing roadway geometry/traffic control.
- **Cumulative (2040) plus Proposed Project Conditions**
Evaluates year 2040 traffic volumes and traffic generated by the project.

Operating Conditions and Criteria

Operating conditions experienced by drivers are described in terms of Level of Service (LOS), which is a qualitative measure of factors such as delay, speed, travel time, freedom to maneuver, and driving comfort and convenience. Levels of service are represented by a letter scale from LOS A to LOS F, with LOS A representing the best performance and LOS F representing the poorest performance.

¹ *River Crossing Marketplace Specific Plan Traffic Impact Analysis*, Omni-Means, A GHD Company, 2017.

² Note: Some movements presented in the *Redding Rancheria Traffic Impact Study* are higher than those presented in the *River Crossing Marketplace Specific Plan Traffic Impact Analysis* report.

³ Adjusted SCRTDF Model based on I-5 / S. Bonnyview Interchange PSR Technical Memorandum 1 – 14, Omni-Means to City of Redding – Engineering, May 06, 2016 – April 28, 2017.

Table 1 relates the operational characteristics associated with each level of service category for both signalized and unsignalized intersections. **Table 2** and **Table 3** list the level of service thresholds for roadway segments, one-lane and multilane respectively. Level of service thresholds for two-lane highways are based on average travel speed and the percent time spent following based on the segment’s classification. Level of service on Class I facilities is defined in terms of average travel speed as well as percent time-spent-following (where mobility is critical). Percent time-spent-following is defined as the average percent of total travel time that vehicles must travel in platoons behind slower vehicles due to inability to pass on a two-lane highway. The level of service on Class II facilities is based only on the percent time-spent-following. Level of service thresholds for multilane highways are based on density measured in passenger cars per mile per lane. **Table 4** lists the level of service thresholds for freeway segments which is also based on density.

Table 1 – Intersection Level of Service Definitions

Level of Service	Description	Signalized (Avg. control delay per vehicle)	Unsignalized (Avg. control delay per vehicle)	Volume to Capacity
A	Free flow with no delays. Users are virtually unaffected by others in the traffic stream	≤ 10	≤ 10	And ≤ 1.0
B	Stable traffic. Traffic flows smoothly with few delays.	> 10 – 20	> 10 – 15	And ≤ 1.0
C	Stable flow but the operation of individual users becomes affected by other vehicles. Modest delays.	> 20 – 35	> 15 – 25	And ≤ 1.0
D	Approaching unstable flow. Operation of individual users becomes significantly affected by other vehicles. Delays may be more than one cycle during peak hours.	> 35 – 55	> 25 – 35	And ≤ 1.0
E	Unstable flow with operating conditions at or near the capacity level. Long delays and vehicle queuing.	> 55 – 80	> 35 – 50	And ≤ 1.0
F	Forced or breakdown flow that causes reduced capacity. Stop and go traffic conditions. Excessive long delays and vehicle queuing.	> 80	> 50	Or > 1.0

Source: Transportation Research Board, *Highway Capacity Manual 2010*, National Research Council, 2010.

Table 2 – Roadway Segment Level of Service Thresholds: Two-Lane Highway

Level of Service	Class I ^a Percent Time Spent Following (%)	Class I ^a Average Travel Speed (mph)	Class II ^b Percent Time Spent Following (%)
A	<= 35	=> 55	<= 40
B	> 35 – 50	> 50 – 55	> 40 – 55
C	> 50 – 65	> 45 – 50	> 55 – 70
D	> 65 – 80	> 40 – 45	> 70 – 85
E	> 80	<= 40	> 85

Source: Transportation Research Board, *Highway Capacity Manual 2010*, National Research Council, 2010.

^aClass I: Highways on which motorists expect to travel at relatively high speeds, including major intercity routes, primary arterials, and daily commuter routes.

^bClass II: Highways on which motorists do not necessarily expect to travel at high speeds, including access routes, scenic and recreational routes that are not primarily arterials, and routes through rugged terrain.

LOS F applies whenever the flow rate exceeds the segment capacity.

Table 3 - Roadway Segment Level of Service Thresholds: Multilane Highway

Level of Service (LOS)	Free Flow Speed (mph)	Density (pc/mi/ln)
A	All	> 0 – 11
B	All	> 11 – 18
C	All	> 18 – 26
D	All	> 26 – 35
E	60	> 35 – 40
	55	> 35 – 41
	50	> 35 – 43
	45	> 35 – 45
F (demand exceeds capacity)	60	> 40
	55	> 41
	50	> 43
	45	> 45

Source: *Highway Capacity Manual, 2010*

Note: Passenger Cars per Mile per Lane (pc/mi/ln)

Table 4 – Freeway Facility Level of Service Criteria

Level of Service (LOS)	Basic Segments Density (pc/mi/ln)	Merge/Diverge Segments Density (pc/mi/ln)
A	≤ 11	≤ 10
B	> 11 – 18	> 10 – 20
C	> 18 – 26	> 20 – 28
D	> 26 – 35	> 28 – 35
E	> 35 – 45	> 35
F*	> 45*	*

Source: *Highway Capacity Manual, 2010*

* Demand exceeds capacity

Note: Passenger Cars per Mile per Lane (pc/mi/ln)

Table 5 summarizes the local level of service standards.

Table 5 – Local Level of Service Standards

Jurisdiction	Satisfactory Criteria	Significance Criteria
Shasta County	LOS C	Project causes LOS to fall below LOS C. The project is considered to have a significant impact if the project increases the average delay by more than 5 seconds per vehicle at an intersection having an unacceptable LOS without project traffic.
Redding	LOS C/D	Project causes LOS to fall below LOS C for arterial streets and intersections. The project is considered to have a significant impact if the project increases the average delay by more than 5 seconds per vehicle (and meets peak hour volume signal warrants for stop controlled intersections) at an intersection having an unacceptable LOS without project traffic. *Note LOS D is considered acceptable for areas in the downtown area, as well as along streets within the state highway system and corresponding intersections.
Anderson	LOS D	Project causes LOS to fall below LOS D.
Caltrans	LOS D	Project causes LOS to fall below LOS D at intersections and highways. If LOS is already below criteria, the existing LOS and related measure of effectiveness (i.e. delay, percent time-spent-following, and average speed) are to be maintained.

- Caltrans *Guide for the Preparation of Traffic Impact Studies*, December 2002
- State Route 273 *Transportation Concept Report*, Caltrans District 2, Office of Planning, December 2004

Traffic analysis was completed using Synchro and VISSIM software at intersections and Highway Capacity Software (HCS) at roadway and freeway segments. Both software platforms are based on the methodology of the *Highway Capacity Manual (HCM, 2010)*.

Significant Impact and Mitigation Thresholds

Shasta County

The Shasta County General Plan, Circulation Element, dated September 2004, was used to determine the Proposed Project impacts to facilities within the County's jurisdiction. These guidelines state that Shasta County shall adopt LOS C standards for any new roads. New developments shall not be approved unless traffic impacts are adequately mitigated. Such mitigation may take the form of, but not limited to, provision of capacity improvements and demand reduction measures. The County has determined that a project may have significant impacts on traffic and circulation if it does any of the following:

- Causes an intersection or roadway segment that operates acceptable without the project to degrade to an unacceptable LOS due to the addition of traffic from the project
- Causes an intersection that is operating at an unacceptable LOS without the project and experiences an increase of 5 or more seconds of control delay due to the addition of the project traffic.
- Causes a roadway segment that operates unacceptably to experience an increase in its daily volume to a capacity ration of 0.05 or greater due to the addition of project traffic.

City of Redding

The *City of Redding Traffic Impact Analysis Guidelines*, dated January 2009, was used to determine the Proposed Project impacts to facilities within the City of Redding's jurisdiction. These guidelines state that the minimum LOS standard to be used in the analysis shall be LOS C for most arterial streets and their intersections and LOS D for the Downtown area or for streets within the State highway system and interchanges. When an existing Redding facility is operating at less than appropriate target LOS, the following thresholds are used to determine significant impacts:

- The project increases the delay by more than 5 seconds per vehicle at an intersection having an unacceptable LOS without project traffic.
- The project causes the v/c ratio to increase by more than 0.05 on a roadway having an unacceptable LOS without project traffic.
- The project causes the amount of traffic on a local street to exceed 2,000 daily vehicles or 180 peak hour vehicles; or adds any amount of traffic to a local street which exceeds these limits without the project.
- The project causes the amount of traffic on a residential collector, having individual access to single family lots, to exceed 4,000 daily vehicles or 360 peak hour vehicles; or adds any amount of traffic to a residential collector which exceeds these limits without the project.

For impacts that occur in cumulative conditions, the project applicant is responsible for mitigating the impact by providing a fair share contribution. If the project's fair share is 25 percent or more, then the recommended improvements shall be installed at the time

of the development, subject to a reimbursement agreement. If the recommended improvement is included in the current list of Traffic Impact Fee projects, reimbursement will be in the form of either TIF credit or payment from the TIF. If the project's fair share is less than 25 percent, then the project will be required to pay its fair share of the cost of the improvements to be constructed later by others, prior to the realization of the impact. If the recommended improvement is included in the current list of TIF projects, then payment of the project's TIF fee will be considered mitigation for the impact.

City of Anderson

The City of Anderson General Plan, Circulation Element, dated May 2007, was used to determine the Proposed Project impacts to facilities within the City of Anderson's jurisdiction. These guidelines state that the City of Anderson strives to maintain a LOS D as the minimum acceptable service standard for intersections during peak periods. For this study, the Shasta County significance was used for City of Anderson facilities.

Caltrans

The *Caltrans Guide for the Preparation of Traffic Impact Studies*, dated December 2002, was used to determine the Proposed Project impacts to facilities within Caltrans's jurisdiction. These guidelines state that Caltrans endeavors to maintain a target LOS at the transition between LOS C and LOS D for all of its facilities. However, in the *State Route 273 Transportation Concept Report*, Caltrans indicated that a lower level of service (LOS D) is acceptable before mitigation would be required². When an existing State Highway facility is operating at less than appropriate target LOS, the existing measure of effectiveness (MOE) for that facility should be maintained. This means that, for facilities that operate at a LOS E or F, a significant project impact would occur if a project causes a decrease in the MOE for that facility.

Cumulative traffic impacts are those projected to occur when project traffic is added to future traffic, and where this resulting combined future traffic exceeds each Jurisdiction's significance criteria. Future traffic is based on additional proposed developments in the area (short and long-term cumulative). The project applicant would be responsible for mitigating its cumulatively considerable impact by providing a fair share contribution towards the implementation of mitigation measures needed to improve the intersection or roadway segment to an acceptable LOS or to a level that is equal to better than pre-project operations. A fair share contribution is based on the projects proportionate traffic contribution to the overall future traffic volumes at locations which exceed the significance criteria.

Study Areas

The proposed project site is located in the southwest quadrant of the I-5 interchange with South Bonnyview Road. While the I-5/South Bonnyview Road interchange is located within the City of Redding's jurisdictions, the project site is located immediately south of and outside the City's boundary within unincorporated Shasta County.

² *State Route 273 Transportation Concept Report*, Caltrans District 2, Office of Planning, December 2004.

Two additional site alternatives were evaluated. The Anderson Site is located at the northwest quadrant of the I-5 and North Street Interchange, off of Oak Street within the City of Anderson. The Win River Casino Site is located at the intersection of Market Street (SR-273) and Canyon Road, off of Redding Rancheria Road in Shasta County.

Intersections Included in Analysis

The Project would generate new vehicular trips that would increase traffic volumes on the nearby street network. To assess changes in traffic conditions associated with the Project, the following study intersections were selected based on relevance to the Project and additional site alternatives, and the existing traffic conditions.

Figure 1 illustrates the study intersections for the Strawberry Fields Site:

1. South Bonnyview Road @ Market Street (SR-273) – Caltrans
2. South Bonnyview Road @ East Bonnyview Road – City of Redding
3. South Bonnyview Road @ Bechelli Lane – City of Redding
4. South Bonnyview Road @ I-5 SB Ramps – Caltrans
5. South Bonnyview Road @ I-5 NB Ramps – Caltrans
6. South Bonnyview Road @ Churn Creek Road – City of Redding
7. Churn Creek Road @ Alrose Lane – City of Redding
8. Churn Creek Road @ Victor Avenue – City of Redding
9. Churn Creek Road @ Rancho Road – City of Redding
10. Churn Creek Road @ Smith Road – Shasta County
24. Smith Road @ Proposed Project South Driveway (*Options 1 & 2*) – Shasta County
25. Smith Road @ I-5 SB Ramps (*Option 2*) – Caltrans
26. Smith Road @ I-5 NB Ramps (*Option 2*) – Caltrans

Figure 2 illustrates the study intersections for the Anderson Site (City of Anderson):

17. Market Street (SR-273) @ North Street – Caltrans
18. North Street @ Oak Street – City of Anderson
19. North Street @ I-5 SB Off Ramp – Caltrans
20. North Street @ I-5 NB On-Ramp/ McMurray Drive – Caltrans
21. Balls Ferry Road @ Oak Street – City of Anderson
22. Balls Ferry Road @ I-5 SB On-Ramp/ Ventura Street – Caltrans
23. Balls Ferry Road @ I-5 NB Off-Ramp/ McMurray Drive – Caltrans

Figure 3 illustrates the study intersections for the Win River Casino Site:

1. South Bonnyview Road @ Market Street (SR-273) – Caltrans
11. Market Street (SR-273) @ Westwood Avenue – Caltrans
12. Market Street (SR-273) @ Clear Creek Road – Caltrans
13. Market Street (SR-273) @ Girvan Road – Caltrans
14. Market Street (SR-273) @ Redding Rancheria Road – Caltrans
15. Redding Rancheria Road @ Canyon Road – City of Redding
16. Market Street (SR-273) @ Happy Valley Road – Caltrans

Roadway Segments Included in Analysis

Roadway segments were selected for evaluation. Roadway segments studied are illustrated in **Figures 1-3**.

Strawberry Fields Site:

1. South Bonnyview Road, west of Bechelli Lane
2. Bechelli Lane, south of South Bonnyview Road
3. Churn Creek Road, east of Alrose Lane
4. Smith Road, west of Churn Creek Road

Anderson Site:

1. North Street west of Oak Street
2. Oak Street south of North Street
3. North Street east of Oak Street
4. Oak Street north of North Street

Win River Casino Site:

1. Market Street (SR-273) north of Redding Rancheria Road
2. Market Street (SR-273) south of Redding Rancheria Road
3. Canyon Road south of Redding Rancheria Road

Freeway Segments Included in Analysis

Freeway segments were selected for evaluation. Freeway segments studied are illustrated in **Figures 1-3**.

Strawberry Fields Site:

Northbound and Southbound:

1. I-5 south of Bonnyview Road Off-Ramp
2. Bonnyview Road Off-Ramp
3. I-5 between Bonnyview Road Off-Ramp and On-Ramp
4. Bonnyview Road On-Ramp
5. I-5 North of Bonnyview Road On-Ramp
6. I-5 South of Smith Road Off-Ramp*
7. Smith Road Off-Ramp*
8. I-5 between Smith Road Off-Ramp and On-Ramp*
9. Smith Road On-Ramp*

(*Option 2 only)

Alternative Site (City of Anderson):

Northbound and Southbound:

1. I-5 South of Balls Ferry Road Off-Ramp
2. Balls Ferry Road On-Ramp/Off-Ramp
3. I-5 between Balls Ferry Road Off-Ramp and North Street On-Ramp
4. North Street On-Ramp/Off-Ramp
5. I-5 between North Street On/Off-Ramp and Riverside Ave On/Off-Ramp

Win River Casino Site:

- None

EXISTING (2016) CONDITIONS

Existing Roadways

Below is a description of the roadway facilities and roadway segments included in this study.

I-5 is a major interstate freeway. It runs north-south and connects the cities in northern California and Oregon to the Sacramento Valley in the south. I-5 is also a major truck route, designated as part of the National STAA Network. I-5 runs along the eastern edge of the Proposed Project Site in Redding and the eastern edge of the Alternative Project Site in Anderson. Across the study area, I-5 has a four-lane divided cross section.

Market Street (SR-273) is a divided, four-lane expressway, running north-south along the Southern Pacific Railroad tracks. The expressway serves to connect Redding and Anderson, with limited access to adjacent land. SR-273 is designated a terminal access STAA Route. It intersects South Bonnyview Road north of the Win River Casino Ssite. All intersections are at grade.

South Bonnyview Road is a two to four lane arterial within the City of Redding with curbs and gutters. The road runs east-west, connecting SR-273, I-5, and Churn Creek Road. A class II bike path runs along the route from SR-273 to I-5. Sidewalks are present from SR-273 to Alrose Lane on the east side of I-5.

East Bonnyview Road is a two lane collector within the City of Redding with curb and gutter on the east side of the roadway. The road runs north-south connecting residential housing to South Bonnyview Road. Sidewalks are present along the east side of the roadway.

Bechelli Lane is a two-lane arterial north of South Bonnyview Road and a two-lane local roadway south of Bonnyview Road within the City of Redding. The roadway connects residential housing to Cypress Avenue and South Bonnyview Road. It runs north-south, parallel to I-5.

Churn Creek Road runs north-south from SR-299 to Knighton Road within the City of Redding. North of South Bonnyview Road, Churn Creek Road is a four-lane divided arterial. After the intersection with Bonnyview Road, Churn Creek Road narrows to two lanes and runs east-west for about a mile before continuing south to Airport Road.

Alrose Lane is a two-lane local roadway within the City of Redding. The roadway runs north-south and connects residential housing to Churn Creek Road.

Victor Avenue is a two-lane arterial roadway within the City of Redding. The roadway runs north-south and connects Churn Creek Road with SR-44 to the north.

Rancho Road is a two-lane arterial roadway within the City of Redding. The roadway runs east-west and connects Churn Creek Road with residential housing to the east.

Smith Road is a two-lane local roadway within Shasta County running east-west from Churn Creek Road to the Sacramento River.

Westwood Avenue is a two-lane local roadway within the City of Redding. The roadway runs east-west and connects SR-273 to residential housing to the west.

Clear Creek Road is a two-lane arterial roadway within the City of Redding. The roadway runs east-west and connects SR-273 to residential housing and businesses to the west.

Girvan Road is a two-lane collector roadway within the City of Redding. The roadway runs east-west and connects SR-273 to residential housing to the east.

Redding Rancheria Road is a two-lane collector. It joins Canyon Road and intersects SR-273 just east of the Win River Casino Resort. It is the major access point for the existing Win River Casino Resort facilities.

Canyon Road is a two-lane arterial running northeast and southwest within the City of Redding. The road extends from SR-273 to Happy Valley Road.

North Street is a four-lane arterial roadway running east-west from the Sacramento River to SR-273. This road is a designated Truck Route under the City of Anderson Municipal Code.

Balls Ferry Road is a four-lane arterial roadway running east-west from the I-5 to SR-273.

Oak Street is a two-lane local road running parallel to SR-273 within the City of Anderson, to the east of the alternative project site.

McMurray Drive is a two-lane local road running parallel to I-5 within the City of Anderson. The roadway connects the I-5 Northbound ramps.

Ventura Street is a two-lane local road running parallel to I-5 within the City of Anderson. The roadway connects North Street with Balls Ferry Road.

Happy Valley Road is a two-lane arterial running northeast and southwest within Shasta County. The road extends from SR-273 to Canyon Road, continuing south to Gas Point Road.

Existing Lane Configurations and Traffic Control

Existing intersection lane configurations and traffic control at study intersections are illustrated in **Figures 4-6**. Traffic signals are located at 16 of the 23 study intersections.

Existing Traffic Turning Movement Volumes

Friday and Saturday intersection turning movement volumes were manually collected in July 2016 at all project study area intersections. Additional intersection turning movement counts were manually collected in September 2016. Volumes were collected during the PM peak period, from 5:00 PM to 7:00 PM on both Friday and Saturday, when the combination of background traffic and casino traffic is at the highest levels. Based on existing traffic volume information and expected trip generation from the Project, it was determined that the Friday and Saturday evening peak periods represent the worst case periods to evaluate. Additionally, September traffic counts were higher than July traffic counts, suggesting season variation in the Project vicinity. Based on a comparison of the July and September traffic counts, adjustments were applied to the July turning movement counts to proportionally increase volumes to reflect observed seasonal variation. The resulting Existing (2016) Friday and Saturday afternoon peak hour volumes are shown in **Figures 7-9**. Traffic volume data sheets are included in **Appendix A**.

Existing Pedestrian and Bicycle Facilities

According to the City of Redding *Bikeway Action Plan: 2010-2015*³, there is a class II bicycle facility running along South Bonnyview Road, from SR-273 to Bechelli Road, and on Churn Creek Road east of South Bonnyview Road. Bicycle facilities are planned for South Bonnyview Road between Bechelli Lane and Churn Creek Road. There are additional class II facilities extending north on East Bonnyview Road, Bechelli Lane and Victor Avenue. None of these facilities connect directly to the Strawberry Fields Site; however, bicycle facilities are planned along the eastern side of the Sacramento River adjacent to the Strawberry Fields Site. Additionally, sidewalks are present on Bechelli Lane north of the Strawberry Fields Site. No sidewalks exist on Smith Road.

According to the Shasta County *2010 Bicycle Transportation Plan*⁴, the Anderson Site in the City of Anderson is not located in close proximity to existing bicycle facilities. However, bicycle access is provided along sections of Market Street (SR-273) and I-5 north and south of the Anderson Site. Bicycle facilities are planned on local roads in the City of Anderson on East Street, North Street, Ventura Street, and Balls Ferry Road in the project vicinity. Additionally, sidewalks are present on North Street and Oak Street south of Mill Street in the project vicinity.

The Win River Casino Site is located adjacent to Market Street (SR-273) which has 15 miles open to bicyclists between the City of Redding to the City of Anderson. Additionally, sidewalks are present on both sides of Redding Rancheria Road.

³ City of Redding, *Bikeway Action Plan: 2010-2015*, 2010.

⁴ Shasta County, *2010 Bicycle Transportation Plan*, 2010.

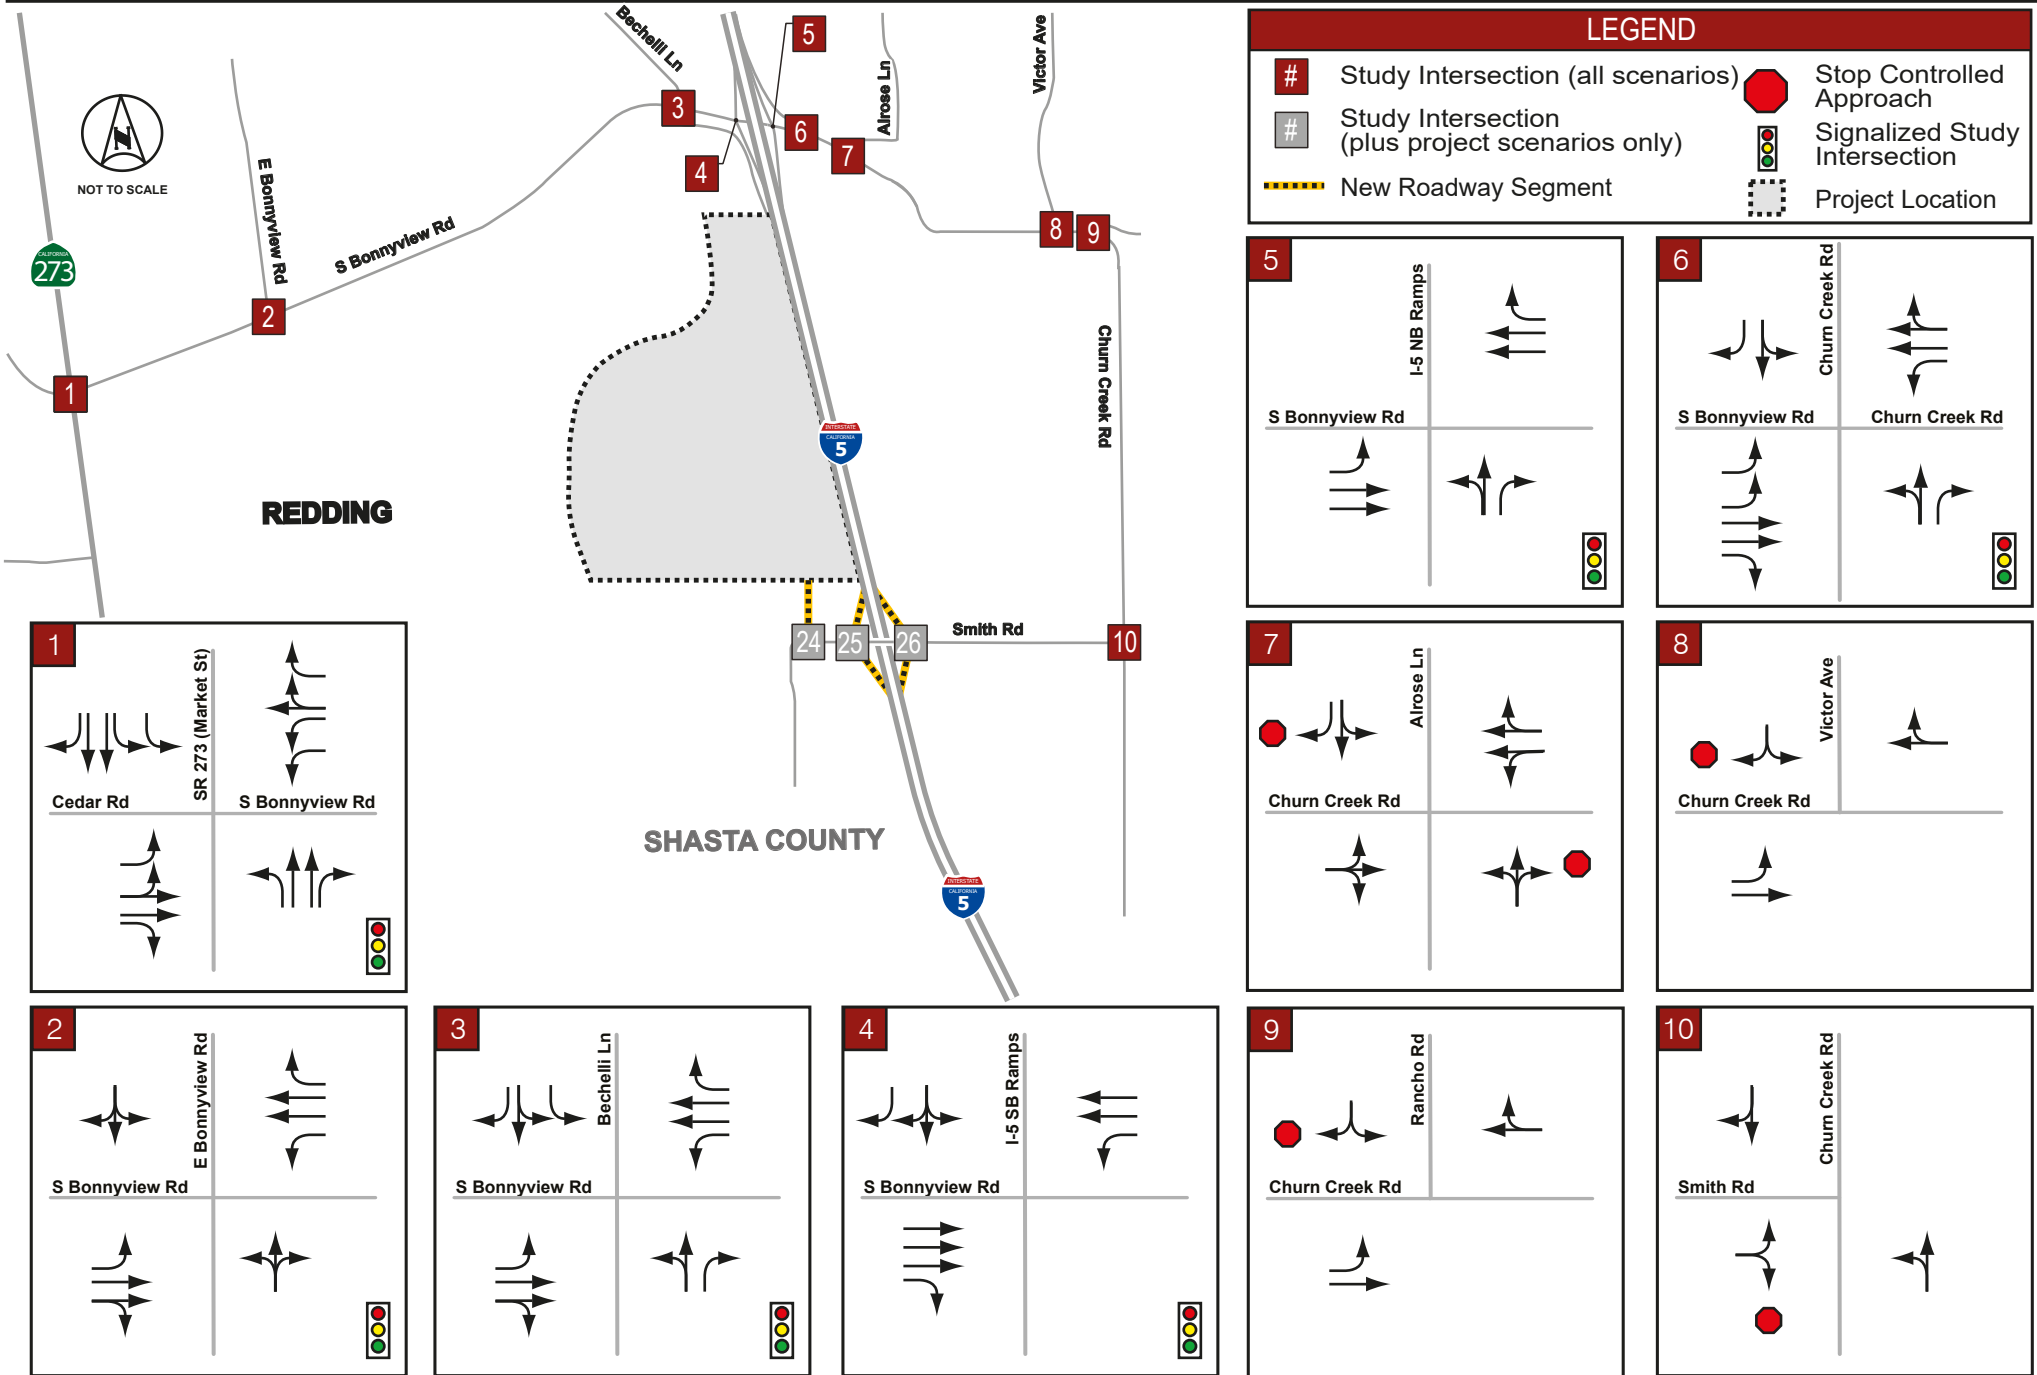

Existing Transit Service

Transit service in Redding and Anderson is provided by the Redding Area Bus Authority (RABA). There are no transit stops in close proximity to the Strawberry Fields Site.

Route 3 and the Anderson Commuter (AC) Route serve the SR-273 corridor with stops near the Anderson Site at North Street, and near the Win River Casino Site at Canyon Road. Route 3 includes stops along the western portion of South Bonnyview Road west of the Strawberry Fields Site. The Route 3 transit services operate during the week and Saturdays, with buses running every hour. The Anderson Commuter only operates between select commuting hours (7-9 AM) on weekday mornings. Additionally, Route 9 provides service within the City of Anderson with stops on North Street near the Anderson Site.

The existing Win River Resort and Casino offers a shuttle between the Casino site and the Hilton Garden Inn, which is located off of Bechelli Lane.

Existing Levels of Service at Study Intersections

Traffic operations were evaluated under existing traffic conditions. Results of the analysis are presented in **Table 6**, along with the jurisdictional standard for acceptable level of service (as previously described in Operating Conditions and Criteria). The method of intersection control is listed as Signal for a signalized intersection, AWSC for an all-way stop-controlled intersection and SSSC for a side-street stop-controlled intersection. The overall level of service is reported for signalized intersections and all-way stop-controlled intersections. Only the worst movement is reported in the table for SSSC intersections per the methodology of the *Highway Capacity Manual (2010)*. Additional detail of the analysis is provided in **Appendix B**. Results of the analysis indicate that the existing study area intersections currently operate at acceptable levels of service based on established significance criteria.

Table 6 – Existing Intersection Level of Service Summary

ID	Intersection	Control	Target LOS	Peak Hour	Existing (2016)

Notes:

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection, delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the *2010 Highway Capacity Manual*

Existing Conditions Traffic Signal Warrant Analysis

Traffic signals may be justified when traffic operations fall below acceptable thresholds and when one or more signal warrants are satisfied.

Existing traffic volumes at the unsignalized study intersections were compared against the peak-hour warrant in the *California Manual of Uniform Traffic Control Devices*, November 2014. Traffic Signal Warrant #3 – Peak-Hour Volume Warrant is satisfied when traffic volumes on the major and minor approaches exceed thresholds for one hour of the day.

This warrant is generally the first warrant to be satisfied. The warrant applies to traffic conditions during a one-hour peak that are sufficiently high such that minor street traffic experiences excessive delay in entering and crossing the main street due to the high traffic volumes on the main street. The results of a signal warrant analysis are not indicative of impacts, but are provided for informational purposes. When intersections satisfy the peak-hour volume warrant, it does not necessarily mean that a signal will or should be installed. For example, in some instances, the intersection may operate at an acceptable level even though volumes satisfy one or more signal warrants, e.g. a right in/out driveway.

Results of the analysis show that the following intersections currently satisfy Traffic Signal Warrant #3:

- #20 – North Street at McMurray Dr/ I-5 NB On Ramp

Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require additional traffic volumes to be satisfied. A copy of the analysis summary for Traffic Signal Warrant #3 is included in **Appendix C**.

Existing Levels of Service on Study Roadway Segments

Traffic analyses were completed to evaluate the existing PM peak hour of Friday and Saturday operation of the study segments. Results of the analyses are presented in **Table 7** and **Table 8**. Results of the analysis indicate that all of the study roadway segments currently operate at acceptable levels of service based on established significance criteria. Additional detail of the analysis is provided in **Appendix B**.

Existing Levels of Service on Study Freeway Segments

Traffic analyses were completed to evaluate the existing PM peak hour of Friday and Saturday operation of the study segments. Results of the analyses are presented in **Table 9** and **Table 10**. Results of the analysis indicate that all of the study freeway segments currently operate at acceptable levels of service based on established significance criteria. Additional details of the analysis are provided in **Appendix B**.

BASELINE CONDITIONS

The Baseline represents the evaluation of traffic conditions without the Proposed Project. Traffic conditions were evaluated for the Opening Year (2025) and Cumulative (2040) forecast.

Opening Year (2025) Traffic Volumes without Project

Opening Year (2025) traffic volumes for intersections #1-9 were taken directly from the 2017 *River Crossing Marketplace Specific Plan Traffic Impact Analysis Report*¹ Year 2020 Plus Project Conditions volumes². Volumes for intersections #10-23 were developed by linearly interpolating between existing and 2040 traffic volumes. Opening Year (2025) traffic volumes assume the full buildout of the River Crossing Marketplace, including a 152,101-square foot Costco, located in the northwest quadrant of the South Bonnyview Road/I-5 interchange. **Figures 10-12** show the Opening Year traffic volumes at the study intersections. These volumes represent anticipated traffic levels in the year 2025, without the proposed project.

Cumulative (2040) Forecasted Traffic Volumes without Project

Volumes for intersections #1-9 were taken directly from the 2017 *River Crossing Marketplace Specific Plan Traffic Impact Analysis Report*¹ Year 2040 Plus Project Conditions volumes². Volumes for intersections #10-23 were developed using the Shasta County Regional Travel Demand Model (SCRTDF). Cumulative (2040) traffic volumes assume the full buildout of the River Crossing Marketplace, including a 152,101-square foot Costco, located in the northwest quadrant of the South Bonnyview Road/I-5 interchange.

The Shasta County Regional Transportation Agency (SRTA) develops and maintains the regional travel demand model, which forecasts land use and corresponding travel behavior into the future for the Shasta County region. The transportation network in the model was updated to be current as of December 31, 2013, reflects recent improvements over the last few years, and includes forecasted improvements through 2040.

The Long-Term forecast for this study is based on the year 2040 directional link volumes from an adjusted Shasta County Regional Travel Demand Model (SCRTDF) provided by Omni-Means⁵. While the model maintained by Shasta County RTPA is the applicable regional planning resource, modifications to the model have been made to address specific impacts of development proposals within the vicinity of the Strawberry Fields Site. Adjustments to the model include:

- Updated dwelling units and number of employees
- Full development of California Gold site
- Full development of River Crossing Marketplace site
- Full development of Terraces TAZ

⁵ I-5 / S. Bonnyview Interchange PSR Technical Memorandum 1 – 14, Omni-Means to City of Redding – Engineering, May 06, 2016 – April 28, 2017.

Approach volumes were then converted to turning movement volumes using methodologies from National Cooperative Highway Research Program (NCHRP) 255 – Highway Traffic Data for Urbanized Area Project Planning and Design, Chapter 8. NCHRP Report 255 is a compilation of the best techniques that are currently being used in urban areas to forecast future traffic volumes. These techniques were identified through a survey of state and local agencies with follow-up field visits to obtain detailed information on procedural steps and typical applications. The method used to forecast the future turning movement volumes evaluation is the NCHRP’s “Directional Volume Forecast”. For this method, existing and future peak hour volumes, existing peak hour turning movements, and projected directional “D” factors are used to calculate future year turning movements. Existing peak hour intersection turning movements were counted in the field. Future peak hour volumes were obtained from the forecast model. Using the “Directional Volume Forecast” technique, the existing turning movements at each study intersection were factored based on increases in peak hour approach traffic and D factors. Each respective movement was derived using an iterative approach that balances the inflows and outflows for each approach.

Figures 13-15 show the Cumulative (2040) traffic volumes.

LOS Conditions and Impacts at Intersections

Traffic operations were evaluated under the following development conditions:

- Opening Year (2025) conditions without Proposed Project
- Cumulative (2040) conditions without Proposed Project

Results of the analysis are presented in **Table 11**. Additional details are provided in **Appendix D**. As seen in **Table 11**, the following intersections will fail to meet acceptable level of service thresholds in the Opening Year (2025) and Cumulative (2040) conditions based on established significance criteria.

Opening Year (2025) without Project Intersections Operating Deficiently

- #4 – Bonnyview Road at I-5 SB Ramps
- #6 – Bonnyview Road at Churn Creek Road
- #8 – Churn Creek Road at Victor Avenue
- #20 – North Street McMurray Drive/I-5 NB On-Ramp

Cumulative (2040) without Project Intersections Operating Deficiently

- #3 – Bonnyview Road at Bechelli Lane
- #8 – Churn Creek Road at Victor Avenue
- #9 – Churn Creek Road at Rancho Road
- #20 – North Street McMurray Drive/I-5 NB On-Ramp

Table 11 – Baseline Intersection Level of Service Summary

Notes:

Bold represents unacceptable operations.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection (SSSC*), delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the *2010 Highway Capacity Manual*

(c) Under Cumulative (2040) conditions, LOS calculations for intersections 3-7 were performed using VISSIM, all other intersections were performed using Synchro 9.0. (Shaded text represents intersections analyzed with VISSIM.)

(b) LOS calculations are based on the methodology outlined in the *2010 Highway Capacity Manual*

Traffic Signal Warrant Analysis

Opening Year (2025) and Cumulative (2040) traffic volumes at unsignalized study intersections were compared against the peak-hour warrant in the *2014 California Manual on Uniform Traffic Control Devices (CMUTCD)*.

Results of the analysis showed that the following intersections will satisfy Traffic Signal Warrant #3 by the year 2025 and 2040.

- #7 – Churn Creek Road at Alrose Lane
- #8 – Churn Creek Road at Victor Ave
- #9 – Churn Creek Road at Rancho Road
- #19 – North Street at I-5 Off-Ramp
- #20 – North Street at McMurry Drive and I-5 Northbound On-Ramp

Other warrants, such as minimum vehicle volumes, interruption of continuous traffic, and traffic progression, were not evaluated because they generally require additional traffic volumes to be satisfied. A copy of the analysis summary for Traffic Signal Warrant #3 is included in **Appendix C**.

LOS Conditions and Impacts on Roadway Segments without Project

Opening Year (2025) and Cumulative (2040) roadway segment volumes were determined from the turning movement approach volumes at the study intersections within the study area.

Results of the analysis are presented in **Table 12** and **Table 13**. As shown in **Table 12** and **Table 13**, the roadway segments are expected to operate at acceptable levels of service based on established significance criteria under Opening Year (2025) and Cumulative (2040) Conditions. Additional detail of the analysis is provided in **Appendix D**.

LOS Conditions and Impacts on Freeway Segments without Project

Opening Year (2025) and Cumulative (2040) freeway segment volumes were determined from the year 2040 directional link volumes from the Shasta County Regional Travel Demand Model (SCRTDF) travel forecast model³.

Results of the analysis are presented in **Table 14** and **Table 15**. As shown in the **Table 13** and **Table 15**, the freeway segments are expected to operate at acceptable levels of service based on established significance criteria under Opening Year (2025) and Cumulative (2040) Conditions. Additional details of the analysis are provided in **Appendix D**.

PROPOSED PROJECT

Strawberry Fields Site

As part of the project, four development alternatives at the proposed project site were evaluated.

- **Alternative A: Proposed Project** – Consists of a new casino and resort, including an approximately 69,515 square foot casino, 250-room hotel, an event/ convention center, and a retail center, as well as associated parking and infrastructure.
- **Alternative B: Proposed Project with No Retail** – Consists of the same land uses and intensities as the Proposed project without the retail center.
- **Alternative C: Reduced Intensity Alternative** – Consists of a reduced version of the Proposed Project including a new casino and resort, an approximately 250-room hotel, an event/ convention center, and a retail center, as well as associated parking and infrastructure.
- **Alternative D: Non-Gaming Alternative** – Consists of an approximately 128-room hotel, restaurants, and a retail center, as well as associated parking and infrastructure.

Site Access

As part of the project, three project access options were evaluated for each development alternative listed above (A through D). The first option has north access only. For this option, the only access point to the project will be from Bechelli Lane off of Bonnyview Road. The second option has both north and south access. For this second option, the primary access point to the project will be from Bechelli Lane off of Bonnyview Road while secondary access will be provided from a new connecting roadway off of Smith Road. The third option has south access only with a new I-5 interchange at Smith Road. For this option, the only access point to the project will be from a new connecting roadway off of Smith Road. The access options evaluated are listed below:

- North Access Only (Option 1) – access to South Bonnyview Road via Bechelli Lane
- North and South Access (Option 2) – access to South Bonnyview Road via Bechelli Lane and access to Smith Road via a new connecting roadway (overpass only at Smith Road)
- South Access Only (Option 3) – access to Smith Road via a new connecting roadway and a new I-5 Interchange at Smith Road

Project Trip Generation

Trip generation for tribal gaming facilities generally peaks on Saturday evenings. However, background traffic on adjacent streets is lower during this period than during traditional peak weekday periods, resulting in a lower total number of vehicles on the adjacent streets. In addition, casino facilities are open 24 hours a day, 7 days a week and typically do not generate extreme peaks of traffic like other uses. Instead, casino traffic patterns typically follow a smoother curve that builds steadily from early morning until approximately 7:00 PM, after which traffic levels slowly decline. Based on existing traffic volume information and expected trip generation from the Proposed Project, it was determined that the Friday and Saturday PM peak periods represent the worst-case periods to evaluate in this traffic impact study. It is during these periods that the combination of background traffic and casino traffic are anticipated to be at the highest levels. Trip generation estimates for Project Alternatives A-D are summarized in **Tables 16-19⁶**.

Project Trip Distribution and Assignment

Because of the unique nature of casino developments, customers and employees are expected to travel from nearby locations, as well as from the regions surrounding Redding, mainly from within Shasta County. The Proposed Project Site is located just outside of Redding's southern city limit. Based on the likely customer and employee base for the site, the immediate roadway system, and the north-south split of traffic on I-5, it was estimated that approximately half of the project traffic would originate from destinations north of the project site. The majority of these trips are expected to use SR-273 and I-5. Many of the trips from Redding's residential developments located east of I-5 are expected to travel along I-5 to the project site, as well as from neighboring cities to the north. A smaller proportion of trips are expected to use Bechelli Road to/from communities directly north of the Proposed Project Site. Approximately 37 percent of the project traffic is expected to come from south of the site, with the majority of this traffic traveling along I-5 from Anderson, Red Bluff, and other neighboring communities. The project traffic distribution for the proposed site is shown in **Figure 16**.

Project traffic assigned to the study intersections based on the assumed trip distribution and generation for the four development alternatives and three site access alternatives are shown in **Figures 17-28**.

⁶ Trip Generation Details are included in the Redding Rancheria Traffic Impact Study Trip Generation and Distribution Memo, Kimley-Horn, September 7, 2016

(1) Source of Land Use Information: Redding Rancheria Casino Master Plan (February, 2016) and subsequent correspondence with Analytical Environmental Services.

(2) Casino trip generation rates based on local traffic data collected for existing Win River Casino. This rate is also consistent with the traffic data collected for the Win River Casino in 2007. (Omni-Means, 2007). The directional distributions were based on the existing conditions.

(3) The proposed casino facility includes other auxiliary/internal uses in addition to gaming area, such as restaurants, back of house, lounges, etc.

However, only the number of gaming position is used as the independent variable for the purposes of estimating trip generation. This is because the trip generation rates use gaming positions as the independent variable, and were developed based on empirical data from similar existing casino facilities, and include the trips associated with all of the casino uses (gaming areas, restaurants, lounges, back of house, etc.), excluding hotel facilities and convention space.

(4) The project site is located adjacent to Interstate, which carries over 45,000 vehicles per day. For the purposes of this analysis, the base daily and peak hour trip generation estimates are adjusted based on an average diverted link rate of 10 percent. This adjustment is likely conservative and is within the range identified by Caltrans' guidance for pass-by/diverted link trip reductions (Caltrans Guide for the Preparation of Traffic Impact Studies, 2002). Only diverted link trip reductions are used to account for all trips assumed to already be on the adjacent network, including pass-by trips. The diverted link trip reduction is applied only to the trips generated by the casino and the sporting good store.

(5) Trip generation for the proposed conference center was developed based on the estimated number of attendees. The maximum number of event attendees/seats was estimated to be 672 people, based on an average of 15 SF per attendee, which is consistent with industry best practices for conference/event space planning. For the purposes of this traffic analysis, the peak trip generation for the conference center assumes an event with 85 percent of the capacity filled, which corresponds to approximately 571 attendees.

Based on the 2016 study of Cache Creek Casino Resort, it is assumed that when conference/meeting activities are scheduled, 25 percent of the 250 on-site hotel rooms would be occupied by event attendees with an average occupancy of 1.3 attendees per room. Thus, 81 attendees would stay on-site, and not drive to/from an event. The remaining attendees (490) would drive to the site. Assuming an average auto occupancy of 2.2 people per vehicle, approximately 223 vehicles trips would generated. The majority of event trips are anticipated to occur outside of the PM peak traffic period (4:00 PM to 6:00 PM), as events typically have a start time between 7:00 PM and 8:00 PM. It was assumed that 50 percent of event attendees would arrive during the peak hour. Conservatively, 10-percent of these trips were also added as exiting trips during the peak-hour to reflect potential drop-off/pick-up activities and short duration site visits.

(6) Trip generation rates for the proposed event center were based on a previous study of a similar facility at the Cache Creek Casino and Resort. This assumes that most of the patrons visiting the event are already onsite at the casino, and only 30 percent of the patrons represent new trips. Assuming an average auto occupancy of 2.2 people per vehicle, approximately 245 new trips are generated by event facility. It was assumed that 50 percent of patrons would arrive during the peak hour. Conservatively, 10-percent of these trips were also added as exiting trips during the peak-hour to reflect potential drop-off/pick-up activities and short duration site visits.

(7) Trip generation rates for the Hotel (ITE 310) and Sporting Goods Superstore (ITE 861) are based on ITE Trip Generation Manual, 9th Edition. The trip generation rate for the Hotel (ITE 310) is reduced by 75 percent to account for internal capture to/from the casino. For the Sporting Goods Store (ITE 861), it was conservatively assumed that the peak hour of Generator occurs during the peak hour for the Casino Facility.

(8) Daily rates for Casino, Conference Center and Event Center are calculated from the peak hour to daily relationships from Kimley-Horn's 2016 lone Casino and Cash Creek Casino studies; daily rates for Sporting Goods Superstore are are calculated from the peak hour to daily relationships from the ITE use of Department Store (ITE 861)

(1) Source of Land Use Information: *Redding Rancheria Casino Master Plan* (February, 2016) and subsequent correspondence with Analytical Environmental Services.

(2) According to the ITE Trip Generation Manual, 9th Edition, the land use category Hotel (ITE 310) includes supporting facilities such as restaurants, cocktail lounges, and/or retail and service shops. However, the amount of restaurant facilities in the non-gaming land use option was more than would normally be present at an average hotel. It is more conservative to treat the excess restaurants as a separate land use category. Therefore, for the purposes of this trip generation analysis, only the Cafe/Deli and Bakery are considered part of the amenities provided by the hotel. The separate land use categories for the sports bar and specialty restaurant are "High Turnover Restaurant" (ITE 932) and "Quality Restaurant" (ITE 931), respectively.

(3) For Alternative C, a diverted link trip reduction of 15 percent was applied. This adjustment is likely conservative and is within the range identified by Caltrans' guidance for pass-by/diverted link trip reductions. (Caltrans Guide for the Preparation of Traffic Impact Studies, 2002). Only diverted link trip reductions are used to account for all trips assumed to already be on the adjacent network, including pass-by trips.

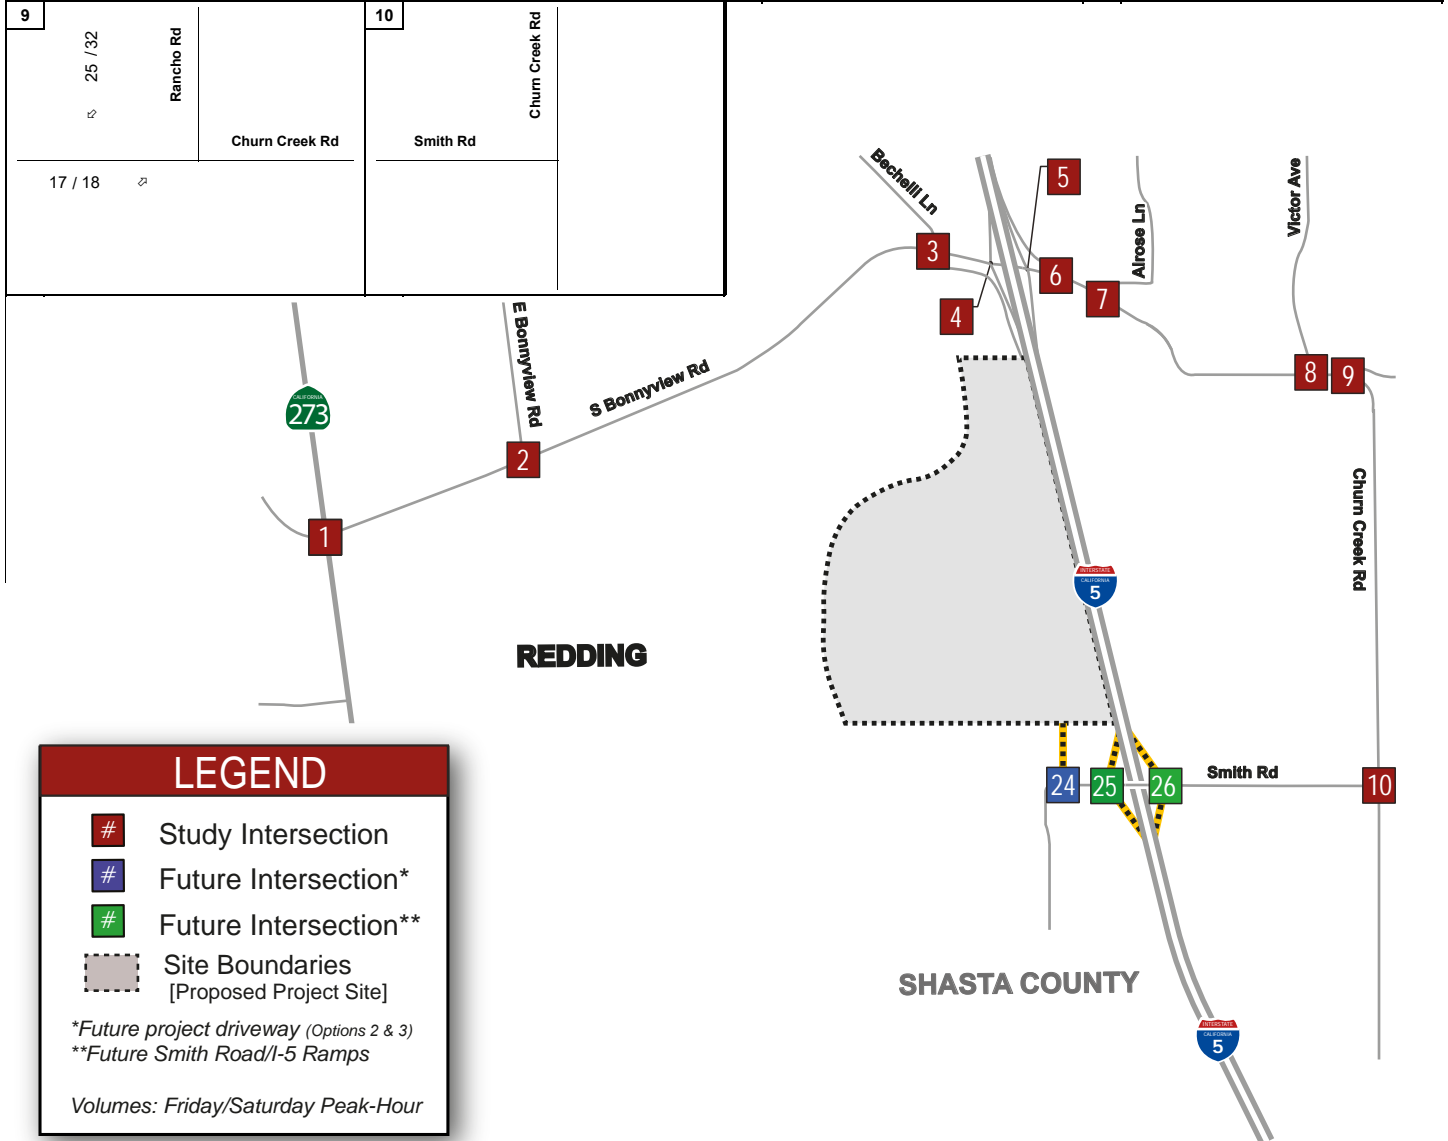

(4) Daily rates for Sporting Goods Superstore are calculated from the peak hour to daily relationships from the ITE use of Department Store (ITE 861)

REDDING

SHASTA COUNTY

Existing Win River Casino Resort Operations

With the construction of the new casino at the Strawberry Fields Site, the existing Win River Resort and Casino is expected to close and be redeveloped into tribal services and housing uses. This change in use at the existing casino site is expected to result in approximately one-third of the trips that currently access the existing Win River Casino Resort remaining on the network. As a result, to accurately evaluate the conditions at the study intersections, roadway segments, and freeway facilities with the addition of the proposed project, the existing Win River Casino Resort's trips were first removed from the network and the trips anticipated to be generated by the redevelopment of the site (one-third of the existing trips per the logic explained above) were the added to the network.

The removal of the existing site's trips from the network required an evaluation of the existing trips' travel patterns. To accomplish this, an origin-destination study using Wi-fi technology in which individual unique devices are matched as multiple locations, was completed during both peak periods to establish patterns for the traffic originating from and destined for the existing site. The Wi-fi data was collected on Market Street (SR-273) north and south of Redding Rancheria Road and along Bonnyview Road to determine the travel patterns of the existing Win River Resort and Casino patrons and the tribal services. The existing casino traffic distribution is shown in **Figure 29**. The existing tribal services traffic distribution is shown in **Figure 30**. Origin-destination data is included in **Appendix E**.

The number of trips that currently access the Win River Resort and Casino was determined based on traffic volume counts taken at the existing casino driveways in July 2016. The number of trips anticipated to be generated by the redevelopment of the existing Win River Resort and Casino was derived using data included in Trip Generation Manual, 9th Edition, published by the Institute of Transportation Engineers (ITE). Trip generation estimates for the existing casino and the proposed redeveloped are summarized in **Table 20**.

The number of trips estimated to be currently accessing the existing casino were subtracted from the roadway network based on the existing casino traffic distribution and the number of trips estimated to be generated by the proposed redevelopment were then added back into the roadway network based on the existing tribal services traffic distribution. The resulting existing Win River Resort and Casino adjustments are shown in **Figure 31**.

Table 20 – Existing Win River Casino Resort Adjustments

Land Use	ITE Code	Quantity	Units	Daily	Weekday PM Peak Hour			Saturday Peak	
					In	Out	Total	In	Out
Existing Site					203	208	411	238	143
Proposed Land Use Changes

[Win River Casino Site]

Volumes: Friday/Saturday Peak-Hour

Anderson Site

As part of the project, a development at an alternative site in the City of Anderson was evaluated.

- **Alternative E: Anderson Site Alternative (City of Anderson)** - Consists of a new casino and resort, including an approximately 69,515 square foot casino, 250-room hotel, an event/ convention center, and a retail center, as well as associated parking and infrastructure.

Site Access

The project site will be located in the northwest quadrant of the I-5 interchange and North Street in the City of Anderson. Site access for the Alternative Project Site is provided by Oak Street, located west of the I-5/North Street interchange in the City of Anderson.

Project Trip Generation

Trip generation rates are consistent with the proposed site trip generation alternatives (described above). Trip generation estimates for Project Alternative E are summarized in **Table 21**⁶.

To accurately evaluate the conditions at the study intersections, roadway segments, and freeway facilities, the existing Win River Casino Resort's trips were removed from the network and the trips anticipated to be generated by the redevelopment of the site were added on the network.

(1) Source of Land Use Information: Redding Rancheria Casino Master Plan (February, 2016) and subsequent correspondence with Analytical Environmental Services.

(2) Casino trip generation rates based on local traffic data collected for existing Win River Casino. This rate is also consistent with the traffic data collected for the Win River Casino in 2007. (Omni-Means, 2007). The directional distributions were based on the existing conditions.

(3) The proposed casino facility includes other auxiliary/internal uses in addition to gaming area, such as restaurants, back of house, lounges, etc.

However, only the number of gaming position is used as the independent variable for the purposes of estimating trip generation. This is because the trip generation rates use gaming positions as the independent variable, and were developed based on empirical data from similar existing casino facilities, and include the trips associated with all of the casino uses (gaming areas, restaurants, lounges, back of house, etc.), excluding hotel facilities and convention space.

(4) The project site is located adjacent to Interstate, which carries over 45,000 vehicles per day. For the purposes of this analysis, the base daily and peak hour trip generation estimates are adjusted based on an average diverted link rate of 10 percent. This adjustment is likely conservative and is within the range identified by Caltrans' guidance for pass-by/diverted link trip reductions (Caltrans Guide for the Preparation of Traffic Impact Studies, 2002). Only diverted link trip reductions are used to account for all trips assumed to already be on the adjacent network, including pass-by trips. The diverted link trip reduction is applied only to the trips generated by the casino and the sporting good store.

(5) Trip generation for the proposed conference center was developed based on the estimated number of attendees. The maximum number of event attendees/seats was estimated to be 672 people, based on an average of 15 SF per attendee, which is consistent with industry best practices for conference/event space planning. For the purposes of this traffic analysis, the peak trip generation for the conference center assumes an event with 85 percent of the capacity filled, which corresponds to approximately 571 attendees.

Based on the 2016 study of Cache Creek Casino Resort, it is assumed that when conference/meeting activities are scheduled, 25 percent of the 250 on-site hotel rooms would be occupied by event attendees with an average occupancy of 1.3 attendees per room. Thus, 81 attendees would stay on-site, and not drive to/from an event. The remaining attendees (490) would drive to the site. Assuming an average auto occupancy of 2.2 people per vehicle, approximately 223 vehicles trips would be generated. The majority of event trips are anticipated to occur outside of the PM peak traffic period (4:00 PM to 6:00 PM), as events typically have a start time between 7:00 PM and 8:00 PM. It was assumed that 50 percent of event attendees would arrive during the peak hour. Conservatively, 10-percent of these trips were also added as exiting trips during the peak-hour to reflect potential drop-off/pick-up activities and short duration site visits.

(6) Trip generation rates for the proposed event center were based on a previous study of a similar facility at the Cache Creek Casino and Resort. This assumes that most of the patrons visiting the event are already onsite at the casino, and only 30 percent of the patrons represent new trips. Assuming an average auto occupancy of 2.2 people per vehicle, approximately 245 new trips are generated by event facility. It was assumed that 50 percent of patrons would arrive during the peak hour. Conservatively, 10-percent of these trips were also added as exiting trips during the peak-hour to reflect potential drop-off/pick-up activities and short duration site visits.

(7) Trip generation rates for the Hotel (ITE 310) and Sporting Goods Superstore (ITE 861) are based on ITE Trip Generation Manual, 9th Edition. The trip generation rate for the Hotel (ITE 310) is reduced by 75 percent to account for internal capture to/from the casino. For the Sporting Goods Store (ITE 861), it was conservatively assumed that the peak hour of Generator occurs during the peak hour for the Casino Facility.

(8) Daily rates for Casino, Conference Center and Event Center are calculated from the peak hour to daily relationships from Kimley-Horn's 2016 Lone Casino and Cash Creek Casino studies; daily rates for Sporting Goods Superstore are calculated from the peak hour to daily relationships from the ITE use of Department Store (ITE 861)

Project Trip Distribution and Assignment

Most of the casino project trips are expected to travel to and from I-5 with origins and destinations in Redding to the north and Red Bluff and neighboring communities to the south. A significant portion of the trips are expected to come from Redding, given the city's population relative to neighboring cities. Therefore, based on the likely customer and employee base for the site and orientation of the regional roadway network, it was estimated that approximately 73 percent of the project traffic would come from the north – the vast majority of these trips using I-5 and SR-273. A smaller proportion of the trips coming from communities in eastern Anderson are expected to use North Street. Approximately 20 percent of the project traffic would come from the south of the site via I-5, with an additional 7 percent traveling to the site from within Anderson via North Street, South Road and Balls Ferry Road. The project traffic distribution for the alternative site is shown in **Figure 32**.

Project traffic assigned to the study intersections based on the assumed trip distribution and generation for the alternative site alternative is shown in **Figure 33**.

- Site Boundaries [Anderson Site]

Volumes: Friday/Saturday Peak-Hour

Win River Casino Site

As part of the project, the expansion of the existing Win River Casino Resort was evaluated.

- **Alternative F: Expansion of Existing Win River Casino Resort-** Consists of the remodeling of the existing event center into additional casino area, a new event center and a 7-story parking garage.

Site Access

Site access to the Win River Casino Site is provided by Redding Rancheria Road, located west of Market Street (SR-273).

Project Trip Generation

Trip generation rates are consistent with the proposed site trip generation alternatives (described above). Trip generation estimates for Project Alternative F are summarized in **Table 22**⁶.

Unlike the other alternatives, this alternative “credits” the proposed project with the trips associated with the existing casino’s operations and evaluates the “proposed project” as only the additional trips anticipated to be generated by the expansion.

Project Trip Distribution and Assignment

The trip distribution for the expansion of the existing Win River Casino Resort was estimated based on the location of the site and the surrounding land uses, as well as the existing traffic flow patterns. The Win River Casino Site is located in southwest Redding, just off SR-273. SR-273 and I-5 will likely carry the vast majority of the project trips. SR-273 is expected to carry an estimated 25 percent of the trips from neighborhoods in southwest Redding, as well as the City of Anderson. Additionally, an estimated 25 percent of the project trips are expected to travel south from downtown Redding and the surrounding developments. The remaining half of the project trips are also expected to use I-5, with a small proportion traveling along Churn Creek Road. The trips will travel then along South Bonnyview Road before reaching SR-273. The project traffic distribution for the existing casino site is shown in **Figure 34**.

Project traffic assigned to the study intersections based on the assumed trip distribution and generation for the existing site alternative is shown in **Figure 35**.

Proposed Project LOS Conditions and Impacts at Intersections

Traffic operations were evaluated under Opening Year (2025) and Cumulative (2040) development conditions.

Opening Year (2025) plus Project

Results of the analysis under Opening Year (2025) plus Project Conditions are presented in **Tables 23-27**. Additional details are provided in **Appendix F**.

Table 23 – Opening Year (2025) plus Proposed Project Intersection Level of Service Summary at Strawberry Fields Site (Alternatives A-D) with North Only Access Alternative (Option 1)

Notes:

Bold represents unacceptable operations. Shading indicates a significant impact at the intersection resulting from the project alternative.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection (SSSC*), delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the 2010 Highway Capacity Manual and performed using Synchro 9.0

				SAT PM	6.4	A	6.3	A

Notes:

Bold represents unacceptable operations. Shading indicates a significant impact at the intersection.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle.

(b) LOS calculations are based on the methodology outlined in the 2010 Highway Capacity Manual and performed using Synchro 9.0

As shown in the **Tables 23 - 27**, the following intersections would fail to meet acceptable level of service thresholds in the Opening Year (2025) scenario. These intersections fail based on established significance criteria and with the addition of project-related traffic to create a potentially significant impact.

Opening Year (2025) Intersection Operating Deficiently

Strawberry Fields Site: North Only Access Alternative (Option 1)

- #3 – Bonnyview Road at Bechelli Lane (Alternatives A, B, C, D)
- #4 – Bonnyview Road at I-5 SB Ramps (Alternatives A, B, C, D)
- #5 – Bonnyview Road at I-5 NB Ramps (Alternative A, B, C, D)
- #6 – Bonnyview Road at Churn Creek Road (Alternative A, B, C, D)
- #8 – Churn Creek Road at Victor Avenue (Alternatives A, B, C, D)

Strawberry Fields Site: North and South Access Alternative (Option 2)

- #3 – Bonnyview Road at Bechelli Lane (Alternatives A, B, C, D)
- #4 – Bonnyview Road at I-5 SB Ramps (Alternatives A, B, C, D)
- #5 – Bonnyview Road at I-5 NB Ramps (Alternative A, B, C, D)
- #6 – Bonnyview Road at Churn Creek Road (Alternative A, B, C, D)
- #8 – Churn Creek Road at Victor Avenue (Alternatives A, B, C, D)

Strawberry Fields Site: South Only Access with New Interchange Alternative (Option 3)

- #4 – Bonnyview Road at I-5 SB Ramps (Alternatives A, B, C, D)
- #5 – Bonnyview Road at I-5 NB Ramps (Alternative A, B, C, D)

Anderson Site (Alternative E)

- #18 – North Street at Oak Street
- #19 – North Street at I-5 Southbound Off Ramp
- #20 – North Street at McMurray Drive and I-5 Northbound On-Ramp

Cumulative (2040) plus Project

Results of the analysis under Cumulative (2040) plus Project Conditions are presented in **Tables 28-32**. Additional details are provided in **Appendix G**.

Notes:

Bold represents unacceptable operations. Shading indicates a significant impact at the intersection resulting from the project alternative.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection (SSSC*), delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the 2010 Highway Capacity Manual and performed using Synchro 9.0

(c) LOS calculations for intersections 3-7 were performed using VISSIM, all other intersections were performed using Synchro 9.0

Notes:

Bold represents unacceptable operations. Shading indicates a significant impact at the intersection.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle.

(b) LOS calculations are based on the methodology outlined in the 2010 Highway Capacity Manual and performed using Synchro 9.0

As shown in the **Tables 28 - 32**, the following intersections would fail to meet acceptable level of service thresholds in the Cumulative (2040) scenario. These intersections fail based on established significance criteria and with the addition of project-related traffic to create a potentially significant impact.

Cumulative (2040) Intersection Operating Deficiently

Strawberry Fields Site: North Only Access Alternative (Option 1)

- #3 – Bonnyview Road at Bechelli Lane (Alternatives A, B, C, D)
- #4 – Bonnyview Road at I-5 SB Ramps (Alternatives A, B, C, D)
- #5 – Bonnyview Road at I-5 NB Ramps (Alternative A, B, C, D)
- #6 – Bonnyview Road at Churn Creek Road (Alternative A, B, C, D)
- #7 – Churn Creek Rd at Alrose Lane (Alternative A, B, C, D)
- #8 – Churn Creek Road at Victor Avenue (Alternatives A, B, C, D)
- #9 – Churn Creek Road at Rancho Road (Alternatives A, B, C, D)

Strawberry Fields Site: North and South Access Alternative (Option 2)

- #3 – Bonnyview Road at Bechelli Lane (Alternatives A, B, C, D)
- #4 – Bonnyview Road at I-5 SB Ramps (Alternatives A, B, C, D)
- #5 – Bonnyview Road at I-5 NB Ramps (Alternative A, B, C, D)
- #6 – Bonnyview Road at Churn Creek Road (Alternative A, B, C, D)
- #7 – Churn Creek Rd at Alrose Lane (Alternative A, B, C, D)
- #8 – Churn Creek Road at Victor Avenue (Alternatives A, B, C, D)
- #9 – Churn Creek Road at Rancho Road (Alternatives A, B, C, D)

Strawberry Fields Site: South Only Access with New Interchange Alternative (Option 3)

- #3 – Bonnyview Rd at Bechelli Lane (Alternatives A, B, C, D)
- #9 – Churn Creek Road at Rancho Road (Alternatives A, B, C, D)

Anderson Site (Alternative E)

- #18 – North Street at Oak Street
- #19 – North Street at I-5 Southbound Off-Ramp
- #20 – North Street at McMurray Drive and I-5 Northbound On-Ramp
- #21 – Balls Ferry Road at Oak Street

Proposed Project Traffic Signal Warrant Analysis

Opening Year (2025) Plus Project and Cumulative (2040) Plus Project traffic volumes at unsignalized study intersections were compared against the peak-hour warrant in the *2014 California Manual on Uniform Traffic Control Devices (MUTCD)*.

Results of the analysis showed that the following intersections would satisfy Traffic Signal Warrant #3 by year 2025 and 2040.

Strawberry Fields Site (Alternatives A, B, C, and D)

- #7 – Churn Creek Road at Alrose Lane
- #8 – Churn Creek Road at Victor Ave
- #9 – Churn Creek Road at Rancho Road
- #19 – North Street at I-5 Off-Ramp
- #20 – North Street at McMurry Drive and I-5 Northbound On-Ramp

Alternative Site Alternative (Alternative E)

- #18 – North Street at Oak Street
- #19 – North Street at I-5 Southbound Off-Ramp
- #20 – North Street at McMurray Drive and I-5 Northbound On-Ramp

It should be noted that intersections #8, #9, and #20 meet the Traffic Signal Warrant in the Baseline scenarios as well. Other warrants such as for minimum vehicle volumes, interruption of continuous traffic, and traffic progression were not evaluated because they generally require higher traffic volumes to be satisfied. A copy of the analysis summary for Traffic Signal Warrant #3 is included in **Appendix C**.

Proposed Project LOS Conditions and Impacts on Roadway Segments

Project trips generated by the proposed Project were added to the Opening Year (2025) and Cumulative (2040) forecast roadway segment volumes.

Traffic analyses were completed to evaluate the operation of the study roadway segments in the Opening Year (2025) and Cumulative (2040), with the addition of the project.

Opening Year (2025) plus Project

Results of the Opening Year (2025) Plus Project analysis are presented in **Tables 33-34**. For the proposed project site, only Development Alternative A (Proposed Project) was evaluated. Development Alternative A has the highest trip generation and therefore represents a worst-case scenario. Additional details of the analysis are provided in **Appendix F**.

As shown in **Tables 33-34**, the roadway segments are expected to operate at acceptable levels of service based on established significance criteria under Opening Year (2025) plus Project Conditions.

Table 33 – Opening Year (2025) plus Proposed Project Roadway Segment Level of Service Summary (Two-Lane)

Cumulative (2040) plus Project

Results of the Cumulative (2040) Plus Project analysis are presented in **Tables 35-36**. For the proposed project site, only Development Alternative A (Proposed Project) was evaluated. Development Alternative A has the highest trip generation and therefore represents a worst-case scenario. Additional details of the analysis are provided in **Appendix G**.

As shown in **Tables 35-36**, the roadway segments are expected to operate at acceptable levels of service based on established significance criteria under Cumulative (2040) plus Project Conditions.

Proposed Project LOS Conditions and Impacts on Freeway Segments

Project trips generated by the proposed project were added to the Opening Year (2025) and Cumulative (2040) forecast freeway segment volumes.

Traffic analyses were completed to evaluate the operation of the study freeway segments in the Opening Year (2025) and Cumulative (2040), with the addition of the project.

Opening Year (2025) plus Project

Results of the Opening Year (2025) Plus Project analysis are presented in **Tables 37-39**. For the proposed project site, only Development Alternative A (Proposed Project) was evaluated. Development Alternative A has the highest trip generation and therefore represents a worst-case scenario. Additional details of the analysis are provided in **Appendix F**.

As shown in **Tables 37-39**, the freeway segments, except for the diverge segment of I-5 at the North Street southbound off-ramp, are expected to operate at acceptable levels of service based on established significance criteria under Opening Year (2025) plus Project Conditions.

Proposed Project Mitigations

The evaluation revealed that several intersection improvements, and one freeway improvement, are needed for the Opening Year (2025) and Cumulative (2040) conditions to mitigate project impacts. The improvements required to mitigate project impacts are described below. The project applicant would be responsible for mitigating its cumulatively considerable impact by providing a fair share contribution towards the implementation of mitigation measures needed to improve the intersection or roadway segment to an acceptable LOS or to a level that is equal to better than pre-project operations. A fair share contribution is based on the projects proportionate traffic contribution to the overall future traffic volumes at locations which exceed the significance criteria. The City of Redding requires that improvements be constructed by the project proponent when the fair share is 25% or more. Based on the Caltrans *Guide for the Preparation of Traffic Impact Studies* (2002), the fair share calculation for cumulative impacts at an intersection is shown in the following equation:

$$P = T / (T_B - T_E)$$

Where:

P = The equitable share for the proposed project's traffic impact.

T = The vehicle trips generated by the project during the peak hour of adjacent State highway facility in vehicles per hour, vph.

T_B = The forecasted traffic volume on an impacted State highway facility at the time of general plan build-out (e.g., 20 year model or the furthest future model data feasible), vph.

T_E = The traffic volume existing on the impacted State highway facility plus other approved projects that will generate traffic that has yet to be constructed/opened, vph.

Opening Year (2025) Intersections Operating Deficiently

Intersections with LOS below established thresholds were investigated to determine the role of the proposed project traffic in under Opening Year (2025) Conditions.

Strawberry Fields Site: North Only Access Alternative (1)

Impact #1 – Bonnyview Road at Bechelli Lane – Intersection #3

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #1 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Construct a second westbound left turn lane and corresponding receiving lane; Restripe the southbound approach to include two left turn lanes and a thru/right lane; Restripe the northbound approach to include a left turn lane, a thru/right lane, and a right turn pocket; add a northbound right turn

permitted overlap signal phase. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 56% for Alternative A, 43% for Alternative B, 53% for Alternative C, and 31% for Alternative D.

Impact #2 – Bonnyview Road at I-5 SB Ramps – Intersection #4

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #2 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Construct a southbound right turn channelized lane with yield control. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 44% for Alternative A, 30% for Alternative B, 40% for Alternative C, and 22% for Alternative D.

Impact #3 – Bonnyview Road at I-5 NB Ramps – Intersection #5

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #3 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Construct a northbound left turn lane. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 30% for Alternative A, 19% for Alternative B, 27% for Alternative C, and 14% for Alternative D.

Impact #4 – Bonnyview Road at Churn Creek Road – Intersection #6

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #4.1 – Alternative A

The significant impact at this intersection can be mitigated with the following improvements: Construct a southbound right turn lane. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 4% for Alternative A.

Mitigation #4.2 – Alternatives B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Add a southbound right turn permitted overlap signal phase. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 2% for Alternative B, 3% for Alternative C, and 1% for Alternative D.

Impact #5 – Churn Creek Road at Victor Avenue – Intersection #8

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #5 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 5% for Alternative A, 4% for Alternative B, 7.5% for Alternative C, and 1% for Alternative D.

Strawberry Fields Site: North and South Access Alternative (2)**Impact #6 – Bonnyview Road at Bechelli Lane – Intersection #3**

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #6.1 – Alternative A

The significant impact at this intersection can be mitigated with the following improvements: Construct a second westbound left turn lane and corresponding

receiving lane; Restripe the southbound approach to include two left turn lanes and a thru/right lane; Restripe the northbound approach to include a left turn lane, a thru/right lane, and a right turn pocket; add a northbound right turn permitted overlap signal phase. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 47% for Alternative A.

Mitigation #6.2 – Alternatives B and C

The significant impact at this intersection can be mitigated with the following improvements: Restripe the southbound approach to include two left turn lanes and a thru/right lane; Restripe the northbound approach to include a left turn lane, a thru/right lane; add a northbound right turn permitted overlap signal phase. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 33% for Alternative B, and 43% for Alternative C.

Mitigation #6.3 – Alternative D

The significant impact at this intersection can be mitigated with the following improvements: Restripe the southbound approach to include two left turn lanes and a thru/right lane; Restripe the northbound approach to include a left turn lane, a thru/right lane. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 24% for Alternative D.

Impact #7 – Bonnyview Road at I-5 SB Ramps – Intersection #4

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #7 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Construct a southbound right turn channelized lane with yield control. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 30% for Alternative A, 18% for Alternative B, 27% for Alternative C, and 13% for Alternative D.

Impact #8 – Bonnyview Road at I-5 NB Ramps – Intersection #5

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #8 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Construct a northbound left turn lane. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 17% for Alternative A, 7% for Alternative B, 14% for Alternative C, and 8% for Alternative D.

Impact #9 – Bonnyview Road at Churn Creek Road – Intersection #6

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #9 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Add a southbound right turn permitted overlap signal phase. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 4% for Alternative A, 2% for Alternative B, 3% for Alternative C, and 1% for Alternative D.

Impact #10 – Churn Creek Road at Victor Avenue – Intersection #8

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #10 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 5% for Alternative A, 4% for Alternative B, 8% for Alternative C, and 1% for Alternative D.

Strawberry Fields Site: South Only Access with New Interchange Alternative (3)**Impact #11 – Bonnyview Road at I-5 SB Ramps – Intersection #4**

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D.

Mitigation #11 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Construct a southbound right turn channelized lane with yield control. This is not a cumulative impact. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 1% for Alternative A. Fair share percentages for Alternatives B, C, and D are 0%.

Impact #12 – Bonnyview Road at I-5 NB Ramps – Intersection #5

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D.

Mitigation #12 – Alternatives A, B, and C

The significant impact at this intersection can be mitigated with the following improvements: Optimize signal timings. This is not a cumulative impact. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 2% for Alternative A, 10 for Alternative B, and 1% for Alternative C.

Anderson Site**Impact #13 – North Street at Oak Street – Intersection #18**

This intersection is expected to exceed significance thresholds for unacceptable operations under Development Alternative E. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #13 – Alternative E

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal or roundabout. The intersection satisfies Traffic Signal Warrant #3 under Opening Year (2025) plus project conditions. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 90%.

Impact #14 – North Street at I-5 Southbound Ramp – Intersection #19

This intersection is expected to exceed significance thresholds for unacceptable operations under Development Alternative E. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #14 – Alternative E

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal or roundabout. The intersection satisfies Traffic Signal Warrant #3 under Opening Year (2025) and Cumulative (2040) plus project conditions. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 81%.

Impact #15 – North Street at McMurray Drive and I-5 Northbound On-Ramp – Intersection #20

This intersection is expected to exceed significance thresholds for unacceptable operations under Development Alternative E. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #15 – Alternative E

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal or roundabout. The intersection satisfies Traffic Signal Warrant #3 under Existing (2016) conditions without the addition of the proposed project. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 39%.

Freeway Impact #16 – I-5 Southbound Off Ramp at North Street Diverge Segment

In addition to the impacts at the study intersections, the project Alternative E (Anderson Site) results in an impact to the diverge freeway segment at the I-5 southbound off-ramp at North Street.

Mitigation #16 – This impact can be mitigated by increasing the length of the deceleration lane to 360-feet, or by adding a third lane to I-5 in the southbound direction. The freeway is anticipated to be improved to three lanes in the southbound and northbound directions by 2040. The project fair share is 24% based on freeway volume.

With the implementation of all mitigation measures listed above, the proposed project would have no significant traffic impacts. **Tables 43-46** summarize the expected intersection levels of service with the identified mitigations under the Opening Year (2025) plus Project conditions. Additional details of the analysis are provided in **Appendix H**.

Notes:

Bold represents unacceptable operations. Shading indicates a significant impact at the intersection.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection, delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the *2010 Highway Capacity Manual* and performed using Synchro 9.0

Cumulative (2040) Intersection Operating Deficiently

Intersections with LOS below established thresholds were investigated to determine the role of the proposed project traffic in under Cumulative (2040) Conditions.

Strawberry Fields Site: North Only Access Alternative (1)

Impact #17 – Bonnyview Road at Bechelli Lane – Intersection #3

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #17 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal with a third eastbound through lane and a right turn pocket, and additional westbound left turn lane, and an additional southbound left turn lane. This improvement is consistent with the Alternative 1B concept proposed by Omni-Means⁶. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 56% for Alternative A, 43% for Alternative B, 53% for Alternative C, and 31% for Alternative D.

Impact #18 – Bonnyview Road at I-5 SB Ramps – Intersection #4

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #18 – Alternative A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Install a diverging diamond interchange at the I-5 northbound and southbound ramps. This improvement is consistent with the Alternative 4B concept proposed by Omni-Means⁶. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 44% for Alternative A, 30% for Alternative B, 40% for Alternative C, and 22% for Alternative D.

⁶ Technical Memorandum 15, Omni-Means to City of Redding – Engineering, April 28, 2017.

Impact #19 – Bonnyview Road at I-5 NB Ramps – Intersection #5

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #19 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the improvements described in Mitigation #18. Mitigation #18 would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 30% for Alternative A, 19% for Alternative B, 27% for Alternative C, and 14% for Alternative D.

Impact #20 – Bonnyview Road at Churn Creek Road – Intersection #6

This intersection is expected to exceed significance thresholds for unacceptable operations under Development Alternative A. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #20 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Install a roundabout. This improvement is consistent with the Alternative 4B concept proposed by Omni-Means⁶. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 4% for Alternative A, 2% for Alternative B, 3% for Alternative C, and 1% for Alternative D.

Impact #21 – Churn Creek Road at Alrose Lane – Intersection #7

This intersection is expected to exceed significance thresholds for unacceptable operations under Development Alternative A. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #21 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the improvements described in Mitigations #18 and #20. Mitigations #18 and #20 would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Under Cumulative (2040) conditions, Intersection #7 meets traffic signal warrants. Fair share calculations are 8% for Alternative A, 5% for Alternative B, 8% for Alternative C, and 3% for Alternative D.

Impact #22 – Churn Creek Road at Victor Avenue – Intersection #8

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to

occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #22 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal. The intersection satisfies Traffic Signal Warrant #3 under Cumulative (2040) without project conditions. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 5% for Alternative A, 4% for Alternative B, 7.5% for Alternative C, and 1% for Alternative D.

Impact #23 – Churn Creek Road at Rancho Road – Intersection #9

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #23 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Add a southbound left turn pocket. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Under Cumulative (2040) conditions, Intersection #7 meets traffic signal warrants. Fair share calculations are 6% for Alternative A, 5% for Alternative B, 5% for Alternative C, and 1% for Alternative D.

Strawberry Fields Site: North and South Access Alternative (2)

Impact #24 – Bonnyview Road at Bechelli Lane – Intersection #3

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #24 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Add a southbound left turn lane; add a westbound left turn lane; add an eastbound right turn pocket. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs.

Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 47% for Alternative A, 33% for Alternative B, 43% for Alternative C, and 24% for Alternative D.

Impact #25 – Bonnyview Road at I-5 SB Ramps – Intersection #4

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #25 – Alternative A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Install a diverging diamond interchange at the I-5 northbound and southbound ramps. This improvement is consistent with the Alternative 4B concept proposed by Omni-Means⁶. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 30% for Alternative A, 18% for Alternative B, 27% for Alternative C, and 13% for Alternative D.

Impact #26 – Bonnyview Road at I-5 NB Ramps – Intersection #5

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #26 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the improvements described in Mitigation #25. Mitigation #25 would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 17% for Alternative A, 7% for Alternative B, 14% for Alternative C, and 8% for Alternative D.

Impact #27 – Bonnyview Road at Churn Creek Road – Intersection #6

This intersection is expected to exceed significance thresholds for unacceptable operations under Development Alternative A. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #27 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Install a roundabout. This improvement is consistent with the Alternative 4B concept proposed by Omni-Means⁶. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation

would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 4% for Alternative A, 2% for Alternative B, 3% for Alternative C, and 1% for Alternative D.

Impact #28 – Churn Creek Road at Alrose Lane – Intersection #7

This intersection is expected to exceed significance thresholds for unacceptable operations under Development Alternative A. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #28 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the improvements described in Mitigations #25 and #27. Mitigations #25 and #27 would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Under Cumulative (2040) conditions, Intersection #7 meets traffic signal warrants. Fair share calculations are 8% for Alternative A, 5% for Alternative B, 8% for Alternative C, and 3% for Alternative D.

Impact #29 – Churn Creek Road at Victor Avenue – Intersection #8

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #29 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal. The intersection satisfies Traffic Signal Warrant #3 under Cumulative (2040) without project conditions. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 5% for Alternative A, 4% for Alternative B, 8% for Alternative C, and 1% for Alternative D.

Impact #30 – Churn Creek Road at Rancho Road – Intersection #9

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #30 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Add a southbound left turn pocket. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Under Cumulative (2040) conditions, Intersection #7 meets traffic signal warrants. Fair share calculations are 3% for Alternative A, 5% for Alternative B, 5% for Alternative C, and 1% for Alternative D.

Strawberry Fields Site: South Only Access with New Interchange Alternative (3)**Impact #31 – Bonnyview Road at Bechelli Lane – Intersection #3**

This intersection is expected to operate at unacceptable under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #31 – Alternatives A, B, C, and D

The significant impact at this intersection can be mitigated with the following improvements: Add a southbound left turn lane; add a westbound left turn lane; add an eastbound right turn pocket. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 14% for Alternative A, 5% for Alternative B, and 12% for Alternative C. Fair share percentages for Alternative D are 0%.

Impact #32 – Churn Creek Road at Rancho Road – Intersection #9

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. The intersection is expected to operate unacceptably under development alternatives A, B, C, and D. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #32 – Alternatives A, B, C, D

The significant impact at this intersection can be mitigated with the following improvements: Construct a southbound right turn lane. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Under Cumulative (2040) conditions, Intersection #7 meets traffic signal warrants. Fair share calculations are 8% for Alternative A, 6% for Alternative B, 6% for Alternative C, and 2% for Alternative D.

Anderson Site**Impact #33 – North Street at Oak Street – Intersection #18**

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternative E. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #33 – Alternative E

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal. The intersection satisfies Traffic Signal Warrant #3 under Opening Year (2025) and Cumulative (2040) plus project conditions. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 90%.

Impact #34 – North Street at I-5 Southbound Off Ramp – Intersection #19

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternative E. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #34 – Alternative E

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal or roundabout. The intersection satisfies Traffic Signal Warrant #3 under Opening Year (2025) and Cumulative (2040) plus project conditions. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 81%.

Impact #35 – North Street at McMurray Drive and I-5 Northbound On-Ramp – Intersection #20

This intersection is expected to exceed significance thresholds for unacceptable operations under baseline conditions and is expected to experience an increase in delay due to the proposed project. This intersection is expected to exceed significance thresholds for unacceptable operations under development alternative E. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #35 – Alternative E

The significant impact at this intersection can be mitigated with the following improvements: Install a traffic signal or roundabout. The intersection satisfies Traffic Signal Warrant #3 under Existing conditions without the addition of the proposed project. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the

intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 39%.

Impact #36 – Balls Ferry Road at Oak Street – Intersection #21

This intersection is expected to exceed significance thresholds for unacceptable operations under development alternative E. Because this impact is projected to occur when project traffic is added to future traffic, this is a significant cumulative impact.

Mitigation #36 – Alternative E

The significant impact at this intersection can be mitigated with the following improvements: Install all way stop control. Because the impact is a cumulative impact, the project would be responsible for a proportionate share of the mitigation costs. Modifying the intersection as proposed in this mitigation would reduce the impact to less than significant and improve the intersection to an acceptable LOS. Fair share calculations are 43%.

With the implementation of all mitigation measures listed above, the proposed project would have no significant traffic impacts. **Tables 47-50** summarize the expected intersection levels of service with the identified mitigations under the Cumulative (2040) plus Proposed Project conditions. Additional details of the analysis are provided in **Appendix I**.

Notes:

Bold represents unacceptable operations. Shading indicates a significant impact at the intersection.

(a) Delay refers to the average control delay for the entire intersection, measured in seconds per vehicle. At a two-way stop-controlled intersection, delay refers to the worst movement.

(b) LOS calculations are based on the methodology outlined in the *2010 Highway Capacity Manual* and performed using Synchro 9.0

ADDITIONAL CONSIDERATIONS

Future Bicycle and Pedestrian Facilities

According to the City of Redding *Bikeway Action Plan: 2010-2015*⁹, bicycle facilities are planned along the Sacramento River adjacent to the Strawberry Fields Site. It is recommended that the project implement strategies to avoid impacts to these planned bicycle facilities. Furthermore, there are no impacts to existing or planned bicycle or pedestrian travel at the alternative project sites (Anderson Site and Win River Casino Site).

As a result, the proposed project would not result in the elimination of existing or planned bicycle or pedestrian facilities, interfere with the implementation of a planned bikeway, or result in unsafe conditions for bicyclists or pedestrians. Nevertheless, it is recommended that the project provide safe, continuous, and accessible bicycle and pedestrian facilities within the project vicinity. As presented in the *Redding Rancheria Draft Access Alternative Concepts* memorandum (January 5, 2017), improvements to Bechelli Lane and new access roadways would include sidewalks and shoulders with adequate width to accommodate bicyclists. In addition, it is recommended that the project consider access to transit services, and consider travel demand management programs for employees.

⁹ City of Redding, *Bikeway Action Plan: 2010-2015*, 2010.

 Jurisdiction:
 Date: 6/7/2017
 Analysis Year: 2017
 Time Period Analyzed: Saturday PM Peak-Hour
 Project Description: Bonnyview Road, w/o Bechelli Lane
 Units: U.S. Customary

Direction 2: WB

LOS and Performance Measures

Flow rate, v_p	903	pc/h/ln
Capacity, C	3800	pc/h/ln
Speed, S	44.1	mi/h
Density, D	10.2	pc/mi/ln
Level of Service, LOS	A	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	3	ft
Median Type	Divided	
Access Point Density	0.0	access points/mi
Demand Volume, V	807	veh/h
Peak Hour Factor, PHF	0.92	
Percent Total Trucks	3.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	45.0	mi/h
Lane width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	3	ft
Total Lateral Clearance, TLC	9.00	ft
Total Lateral Clearance Adjustment, fTLC	0.9	mi/h
Median Type	Divided	
Median Type Adjustment, fM	0.0	mi/h
Access Point Density	0.0	access points/mi
Access Point Density Adjustment, fA	0.0	mi/h
Free-Flow Speed, FFS	44.1	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	44.1	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	44.1	mi/h
Capacity, c	1900	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	1900	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	807	veh/h
Peak Hour Factor, PHF	0.92	
Number of lanes, N	2	ln
Terrain type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	3.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.03	
Heavy Vehicle PCE, ET	2.000	
Heavy vehicle adjustment, f_{hv} :	0.971	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, v_p	452	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, v_p	452	pc/h/ln
Free-Flow Speed, FFS	45.0	mi/h
Capacity, c	1900	pc/h/ln
Breakpoint, BP	1400	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	44.1	mi/h
Density, D	10.2	pc/mi/ln
Level of service, LOS	A

Capacity, C	3800	pc/h/ln
Speed, S	44.1	mi/h
Density, D	8.8	pc/mi/ln
Level of Service, LOS	A	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	3	ft
Median Type	Divided	
Access Point Density	0.0	access points/mi
Demand Volume, V	696	veh/h
Peak Hour Factor, PHF	0.92	
Percent Total Trucks	3.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	45.0	mi/h
Lane width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	3	ft
Total Lateral Clearance, TLC	9.00	ft
Total Lateral Clearance Adjustment, fTLC	0.9	mi/h
Median Type	Divided	
Median Type Adjustment, fM	0.0	mi/h
Access Point Density	0.0	access points/mi
Access Point Density Adjustment, fA	0.0	mi/h
Free-Flow Speed, FFS	44.1	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	44.1	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	44.1	mi/h
Capacity, c	1900	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	1900	pc/h/ln

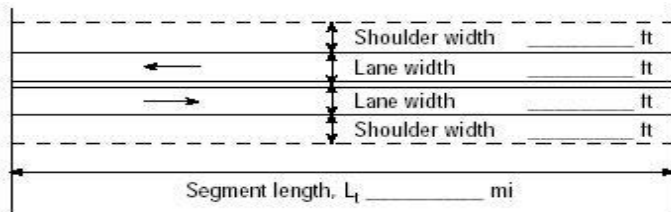

Step 4: Adjust Demand Volume

Demand Volume, V	696	veh/h
Peak Hour Factor, PHF	0.92	
Number of lanes, N	2	ln
Terrain type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	3.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.03	
Heavy Vehicle PCE, ET	2.000	
Heavy vehicle adjustment, f_{hv} :	0.971	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, v_p	390	pc/h/ln

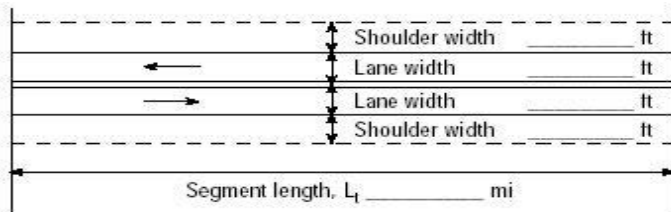

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, v_p	390	pc/h/ln
Free-Flow Speed, FFS	45.0	mi/h
Capacity, c	1900	pc/h/ln
Breakpoint, BP	1400	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	44.1	mi/h
Density, D	8.8	pc/mi/ln
Level of service, LOS	A	

This Multilane Highway Segment text report was created on 6/7/2017 11:02:10

 Jurisdiction:
 Date: 6/7/2017
 Analysis Year: 2017
 Time Period Analyzed: Friday PM Peak-Hour
 Project Description: Bonnyview Road, w/o Bechelli Lane
 Units: U.S. Customary

Direction 2: WB

LOS and Performance Measures

Flow rate, v_p	1304	pc/h/ln
Capacity, C	3800	pc/h/ln
Speed, S	44.1	mi/h
Density, D	14.8	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	3	ft
Median Type	Divided	
Access Point Density	0.0	access points/mi
Demand Volume, V	1165	veh/h
Peak Hour Factor, PHF	0.92	
Percent Total Trucks	3.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	45.0	mi/h
Lane width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	3	ft
Total Lateral Clearance, TLC	9.00	ft
Total Lateral Clearance Adjustment, fTLC	0.9	mi/h
Median Type	Divided	
Median Type Adjustment, fM	0.0	mi/h
Access Point Density	0.0	access points/mi
Access Point Density Adjustment, fA	0.0	mi/h
Free-Flow Speed, FFS	44.1	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	44.1	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	44.1	mi/h
Capacity, c	1900	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	1900	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1165	veh/h
Peak Hour Factor, PHF	0.92	
Number of lanes, N	2	ln
Terrain type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	3.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.03	
Heavy Vehicle PCE, ET	2.000	
Heavy vehicle adjustment, f_{hv} :	0.971	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, v_p	652	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, v_p	652	pc/h/ln
Free-Flow Speed, FFS	45.0	mi/h
Capacity, c	1900	pc/h/ln
Breakpoint, BP	1400	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	44.1	mi/h
Density, D	14.8	pc/mi/ln
Level of service, LOS	B

Volume to capacity ratio, v/c	<i>0.02</i>	

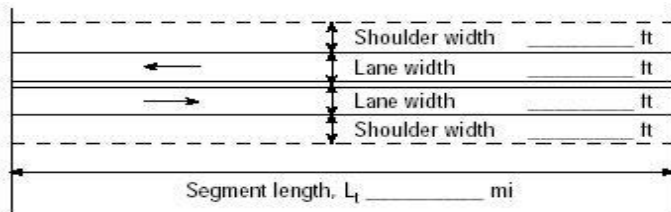

Capacity, $C_{d,ATS}$ (Equation 15-12) veh/h	1656
Capacity, $C_{d,PTSF}$ (Equation 15-13) veh/h	1695
Percent Free-Flow Speed $PFFS_d$ (Equation 15-11 - Class III only)	98.2
Bicycle Level of Service	
Directional demand flow rate in outside lane, v_{OL} (Eq. 15-24) veh/h	28.3
Effective width, Wv (Eq. 15-29) ft	39.66
Effective speed factor, S_t (Eq. 15-30)	4.79
Bicycle level of service score, BLOS (Eq. 15-31)	-3.69
Bicycle level of service (Exhibit 15-4)	A
Notes	
<p>1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.</p> <p>2. If $v_i(v_d \text{ or } v_o) \geq 1,700$ pc/h, terminate analysis--the LOS is F.</p> <p>3. For the analysis direction only and for $v > 200$ veh/h.</p> <p>4. For the analysis direction only</p> <p>5. Exhibit 15-20 provides coefficients a and b for Equation 15-10.</p> <p>6. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.</p>

Project Description: *Redding Rancheria*

Input Data

Segment length, L_1 _____ mi

Class I highway Class II highway
 Class III highway

Terrain Level Rolling

Grade Length _____ mi Up/down

Peak-hour factor, PHF *0.92*

No-passing zone *100%*

% Trucks and Buses, P_T *6%*

% Recreational vehicles, P_R *4%*

Access points *mi* *0/mi*

Analysis direction vol., V_d	<i>229veh/h</i>
Opposing direction vol., V_o	<i>362veh/h</i>
Shoulder width ft	<i>6.0</i>
Lane Width ft	<i>12.0</i>
Segment Length mi	<i>0.2</i>

Average Travel Speed

	Analysis Direction (d)	Opposing Direction (o)
Passenger-car equivalents for trucks, E_T (Exhibit 15-11 or 15-12)	<i>1.5</i>	<i>1.3</i>
Passenger-car equivalents for RVs, E_R (Exhibit 15-11 or 15-13)	<i>1.0</i>	<i>1.0</i>
Heavy-vehicle adjustment factor, $f_{HV,ATS} = 1 / (1 + P_T(E_T - 1) + P_R(E_R - 1))$	<i>0.971</i>	<i>0.982</i>
Grade adjustment factor ¹ , $f_{g,ATS}$ (Exhibit 15-9)	<i>1.00</i>	<i>1.00</i>
Demand flow rate ² , v_i (pc/h) $v_i = V_i / (PHF * f_{g,ATS} * f_{HV,ATS})$	<i>256</i>	<i>401</i>

Free-Flow Speed from Field Measurement	Estimated Free-Flow Speed
Mean speed of sample ³ , S_{FM}	Base free-flow speed ⁴ , BFFS <i>60.0 mi/h</i>
Total demand flow rate, both directions, v	Adj. for lane and shoulder width ⁴ , f_{LS} (Exhibit 15-7) <i>0.0 mi/h</i>
Free-flow speed, $FFS = S_{FM} + 0.00776(\sqrt{v_{HV,ATS}})$	Adj. for access points ⁴ , f_A (Exhibit 15-8) <i>0.0 mi/h</i>
Adj. for no-passing zones, $f_{np,ATS}$ (Exhibit 15-15) <i>3.9 mi/h</i>	Free-flow speed, FFS ($FFS = BFFS - f_{LS} - f_A$) <i>60.0 mi/h</i>
	Average travel speed, $ATS_d = FFS - 0.00776(v_{d,ATS} + V_{o,ATS}) - f_{np,ATS}$ <i>51.0 mi/h</i>
	Percent free flow speed, PFFS <i>85.0 %</i>

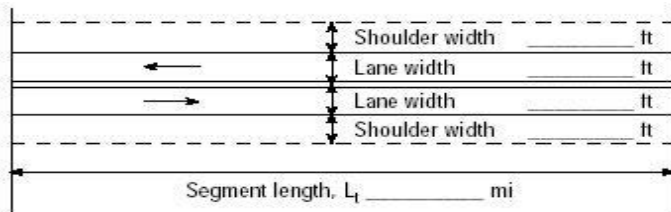

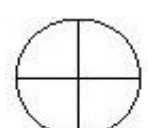

Percent Time-Spent-Following

	Analysis Direction (d)	Opposing Direction (o)
Passenger-car equivalents for trucks, E_T (Exhibit 15-18 or 15-19)	<i>1.1</i>	<i>1.1</i>
Passenger-car equivalents for RVs, E_R (Exhibit 15-18 or 15-19)	<i>1.0</i>	<i>1.0</i>
Heavy-vehicle adjustment factor, $f_{HV} = 1 / (1 + P_T(E_T - 1) + P_R(E_R - 1))$	<i>0.994</i>	<i>0.994</i>
Grade adjustment factor ¹ , $f_{g,PTSF}$ (Exhibit 15-16 or Ex 15-17)	<i>1.00</i>	<i>1.00</i>
Directional flow rate ² , v_i (pc/h) $v_i = V_i / (PHF * f_{HV,PTSF} * f_{g,PTSF})$	<i>250</i>	<i>396</i>
Base percent time-spent-following ⁴ , $BPTSF_d(\%) = 100(1 - e^{-av_d^b})$	<i>30.3</i>	
Adj. for no-passing zone, $f_{np,PTSF}$ (Exhibit 15-21)	<i>50.6</i>	
Percent time-spent-following, $PTSF_d(\%) = BPTSF_d + f_{np,PTSF} * (v_{d,PTSF} / v_{d,PTSF} + V_{o,PTSF})$	<i>49.9</i>	

Level of Service and Other Performance Measures

Level of service, LOS (Exhibit 15-3)	<i>B</i>
Volume to capacity ratio, v/c	<i>0.15</i>

Capacity, $C_{d,ATS}$ (Equation 15-12) veh/h	1669
Capacity, $C_{d,PTSF}$ (Equation 15-13) veh/h	1690
Percent Free-Flow Speed $PFFS_d$ (Equation 15-11 - Class III only)	85.0
Bicycle Level of Service	
Directional demand flow rate in outside lane, v_{OL} (Eq. 15-24) veh/h	248.9
Effective width, Wv (Eq. 15-29) ft	24.00
Effective speed factor, S_t (Eq. 15-30)	4.79
Bicycle level of service score, BLOS (Eq. 15-31)	3.28
Bicycle level of service (Exhibit 15-4)	C
Notes	
<p>1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.</p> <p>2. If $v_i(v_d \text{ or } v_o) \geq 1,700$ pc/h, terminate analysis--the LOS is F.</p> <p>3. For the analysis direction only and for $v > 200$ veh/h.</p> <p>4. For the analysis direction only</p> <p>5. Exhibit 15-20 provides coefficients a and b for Equation 15-10.</p> <p>6. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.</p>

Analysis Time Period	Saturday PM Peak-Hour	Analysis Year	2017

Project Description: *Redding Rancheria*

Input Data

Segment length, L_1 _____ mi

Class I highway Class II highway
 Class III highway

Terrain Level Rolling

Grade Length _____ mi Up/down

Peak-hour factor, PHF 0.92

No-passing zone 100%

% Trucks and Buses, P_T 6%

% Recreational vehicles, P_R 4%

Access points *mi* 0/mi

Analysis direction vol., V_d	362veh/h
Opposing direction vol., V_o	229veh/h
Shoulder width ft	6.0
Lane Width ft	12.0
Segment Length mi	0.2

Average Travel Speed

	Analysis Direction (d)	Opposing Direction (o)
Passenger-car equivalents for trucks, E_T (Exhibit 15-11 or 15-12)	1.3	1.5
Passenger-car equivalents for RVs, E_R (Exhibit 15-11 or 15-13)	1.0	1.0
Heavy-vehicle adjustment factor, $f_{HV,ATS} = 1 / (1 + P_T(E_T - 1) + P_R(E_R - 1))$	0.982	0.971
Grade adjustment factor ¹ , $f_{g,ATS}$ (Exhibit 15-9)	1.00	1.00
Demand flow rate ² , v_i (pc/h) $v_i = V_i / (PHF * f_{g,ATS} * f_{HV,ATS})$	401	256
Free-Flow Speed from Field Measurement	Estimated Free-Flow Speed	
Mean speed of sample ³ , S_{FM}	Base free-flow speed ⁴ , BFFS 60.0 mi/h	
Total demand flow rate, both directions, v	Adj. for lane and shoulder width ⁴ , f_{LS} (Exhibit 15-7) 0.0 mi/h	
Free-flow speed, $FFS = S_{FM} + 0.00776(\sqrt{v_{HV,ATS}})$	Adj. for access points ⁴ , f_A (Exhibit 15-8) 0.0 mi/h	
Adj. for no-passing zones, $f_{np,ATS}$ (Exhibit 15-15) 4.1 mi/h	Free-flow speed, FFS ($FFS = BFFS - f_{LS} - f_A$) 60.0 mi/h	
	Average travel speed, $ATS_d = FFS - 0.00776(v_{d,ATS} + V_{o,ATS}) - f_{np,ATS}$ 50.8 mi/h	
	Percent free flow speed, PFFS 84.6 %	

Percent Time-Spent-Following

	Analysis Direction (d)	Opposing Direction (o)
Passenger-car equivalents for trucks, E_T (Exhibit 15-18 or 15-19)	1.1	1.1
Passenger-car equivalents for RVs, E_R (Exhibit 15-18 or 15-19)	1.0	1.0
Heavy-vehicle adjustment factor, $f_{HV} = 1 / (1 + P_T(E_T - 1) + P_R(E_R - 1))$	0.994	0.994
Grade adjustment factor ¹ , $f_{g,PTSF}$ (Exhibit 15-16 or Ex 15-17)	1.00	1.00
Directional flow rate ² , v_i (pc/h) $v_i = V_i / (PHF * f_{HV,PTSF} * f_{g,PTSF})$	396	250
Base percent time-spent-following ⁴ , $BPTSF_d(\%) = 100(1 - e^{-av_d^b})$	39.5	
Adj. for no-passing zone, $f_{np,PTSF}$ (Exhibit 15-21)	50.6	
Percent time-spent-following, $PTSF_d(\%) = BPTSF_d + f_{np,PTSF} * (v_{d,PTSF} / v_{d,PTSF} + V_{o,PTSF})$	70.5	

Level of Service and Other Performance Measures

Level of service, LOS (Exhibit 15-3)	B
Volume to capacity ratio, v/c	0.24

Capacity, $C_{d,ATS}$ (Equation 15-12) veh/h	1661
Capacity, $C_{d,PTSF}$ (Equation 15-13) veh/h	1690
Percent Free-Flow Speed $PFFS_d$ (Equation 15-11 - Class III only)	84.6
Bicycle Level of Service	
Directional demand flow rate in outside lane, v_{OL} (Eq. 15-24) veh/h	393.5
Effective width, Wv (Eq. 15-29) ft	24.00
Effective speed factor, S_t (Eq. 15-30)	4.79
Bicycle level of service score, BLOS (Eq. 15-31)	3.51
Bicycle level of service (Exhibit 15-4)	D
Notes	
<p>1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.</p> <p>2. If $v_i(v_d \text{ or } v_o) \geq 1,700$ pc/h, terminate analysis--the LOS is F.</p> <p>3. For the analysis direction only and for $v > 200$ veh/h.</p> <p>4. For the analysis direction only</p> <p>5. Exhibit 15-20 provides coefficients a and b for Equation 15-10.</p> <p>6. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.</p>

Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	20.7
Effective width of outside lane, We	40.29
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	-4.08
Bicycle LOS	A

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	480.4
Effective width of outside lane, We	24.00
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	2.74
Bicycle LOS	C

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	-2.78
Bicycle LOS	A

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

-----Level of Service and Other Performance Measures with Passing Lane-----

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	17.4
Effective width of outside lane, We	40.56
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	-4.30
Bicycle LOS	A

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

MULTI LANE HIGHWAY SEGMENT ANALYSIS

File Name: 2025_273N_FRI.xuf
 Analyst:
 Agency:
 Jurisdiction:
 Date: 5/23/18
 Analysis Year: Opening Year (2025)
 Time Period Analyzed: Friday PM Peak-Hour
 Project Description: SR 273, n/o Canyon Rd
 Units: U.S. Customary

Direction 1: NB

LOS and Performance Measures

Flow rate, v_p	852	pc/h/ln
Capacity, C	4400	pc/h/ln
Speed, S	60.0	mi/h
Density, D	7.1	pc/mi/ln
Level of Service, LOS	A	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	6	ft
Median Type	Divided	
Access Point Density	0.0	access points/mi
Demand Volume, V	801	veh/h
Peak Hour Factor, PHF	0.94	
Percent Total Trucks	0.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	60.0	mi/h
Lane width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	6	ft
Total Lateral Clearance, TLC	12.00	ft
Total Lateral Clearance Adjustment, fTLC	0.0	mi/h
Median Type	Divided	
Median Type Adjustment, fM	0.0	mi/h
Access Point Density	0.0	access points/mi
Access Point Density Adjustment, fA	0.0	mi/h
Free-Flow Speed, FFS	60.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	60.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	60.0	mi/h
Capacity, c	2200	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2200	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	801	veh/h
Peak Hour Factor, PHF	0.94	
Number of Lanes, N	2	ln
Terrain type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	0.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.00	
Heavy Vehicle PCE, ET	2.000	
Heavy vehicle adjustment, f_{hv} :	1.000	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, v_p	426	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, v_p	426	pc/h/ln
Free-Flow Speed, FFS	60.0	mi/h
Capacity, c	2200	pc/h/ln
Breakpoint, BP	1400	pc/h/ln
Density at Capacity, D_c	45	pc/mi/ln
Mean Speed under Base Conditions, S	60.0	mi/h
Density, D	7.1	pc/mi/ln
Level of service, LOS	A	

This Multilane Highway Segment text report was created on 5/23/2018 14:18:17

-----Percent Time-Spent-Following with Passing Lane-----

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

-----Level of Service and Other Performance Measures with Passing Lane-----

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	103.3
Effective width of outside lane, We	33.45
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	-0.76
Bicycle LOS	A

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

-----Level of Service and Other Performance Measures with Passing Lane-----

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	28.3
Effective width of outside lane, We	39.66
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	-3.69
Bicycle LOS	A

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Bicycle LOS	C

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Pavement rating, P	3
Flow rate in outside lane, vOL	298.9
Effective width of outside lane, We	24.00
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	2.50
Bicycle LOS	B

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

-----Level of Service and Other Performance Measures with Passing Lane-----

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	78.3
Effective width of outside lane, We	35.52
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	-1.61
Bicycle LOS	A

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

MULTI LANE HIGHWAY SEGMENT ANALYSIS

File Name: 2040_273N_FRI.xuf
 Analyst:
 Agency:
 Jurisdiction:
 Date: 5/30/18
 Analysis Year: Cumulative (2040)
 Time Period Analyzed: Friday PM Peak-Hour
 Project Description: SR 273, n/o Canyon Rd
 Units: U.S. Customary

Direction 1: NB

LOS and Performance Measures

Flow rate, v_p	941	pc/h/ln
Capacity, C	4400	pc/h/ln
Speed, S	60.0	mi/h
Density, D	7.8	pc/mi/ln
Level of Service, LOS	A	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	6	ft
Median Type	Divided	
Access Point Density	0.0	access points/mi
Demand Volume, V	885	veh/h
Peak Hour Factor, PHF	0.94	
Percent Total Trucks	0.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	60.0	mi/h
Lane width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	6	ft
Total Lateral Clearance, TLC	12.00	ft
Total Lateral Clearance Adjustment, fTLC	0.0	mi/h
Median Type	Divided	
Median Type Adjustment, fM	0.0	mi/h
Access Point Density	0.0	access points/mi
Access Point Density Adjustment, fA	0.0	mi/h
Free-Flow Speed, FFS	60.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	60.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	60.0	mi/h
Capacity, c	2200	pc/h/l n
Capacity Adjustments		
Driver Population	All Familiar	
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2200	pc/h/l n

Step 4: Adjust Demand Volume

Demand Volume, V	885	veh/h
Peak Hour Factor, PHF	0.94	
Number of Lanes, N	2	l n
Terrain type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	0.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.00	
Heavy Vehicle PCE, ET	2.000	
Heavy vehicle adjustment, f_{hv} :	1.000	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, v_p	470	pc/h/l n

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, v_p	470	pc/h/l n
Free-Flow Speed, FFS	60.0	mi/h
Capacity, c	2200	pc/h/l n
Breakpoint, BP	1400	pc/h/l n
Density at Capacity, D_c	45	pc/mi /l n
Mean Speed under Base Conditions, S	60.0	mi/h
Density, D	7.8	pc/mi /l n
Level of service, LOS	A

Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

-----Level of Service and Other Performance Measures with Passing Lane-----

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	258.7
Effective width of outside lane, We	24.00
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	3.30
Bicycle LOS	C

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Percent time-spent-following including passing lane, PTSFpl	-	%

-----Level of Service and Other Performance Measures with Passing Lane-----

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	585.9
Effective width of outside lane, We	24.00
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	2.84
Bicycle LOS	C

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Adj. for access point density,(note-3) fA	1.3	mi/h
Free-flow speed, FFSd	58.8	mi/h
Adjustment for no-passing zones, fnp	1.8	mi/h
Average travel speed, ATSD	45.5	mi/h
Percent Free Flow Speed, PFFS	77.5	%

-----Percent Time-Spent-Following-----

Direction	Analysis(d)	Opposing (o)	
PCE for trucks, ET	1.0	1.0	
PCE for RVs, ER	1.0	1.0	
Heavy-vehicle adjustment factor, fHV	1.000	1.000	
Grade adjustment factor, (note-1) fg	1.00	1.00	
Directional flow rate, (note-2) vi	800	670	pc/h
Base percent time-spent-following, (note-4) BPTSFD	68.0	%	
Adjustment for no-passing zones, fnp	26.9		
Percent time-spent-following, PTSFD	82.6	%	

-----Level of Service and Other Performance Measures-----

Level of service, LOS	C	
Volume to capacity ratio, v/c	0.47	
Peak 15-min vehicle-miles of travel, VMT15	40	veh-mi
Peak-hour vehicle-miles of travel, VMT60	147	veh-mi
Peak 15-min total travel time, TT15	0.9	veh-h
Capacity from ATS, CdATS	1695	veh/h
Capacity from PTSF, CdPTSF	1700	veh/h
Directional Capacity	1695	veh/h

-----Passing Lane Analysis-----

Total length of analysis segment, Lt	0.2	mi
Length of two-lane highway upstream of the passing lane, Lu	-	mi
Length of passing lane including tapers, Lpl	-	mi
Average travel speed, ATSD (from above)	45.5	mi/h
Percent time-spent-following, PTSFD (from above)	82.6	
Level of service, LOSd (from above)	C	

-----Average Travel Speed with Passing Lane-----

Downstream length of two-lane highway within effective length of passing lane for average travel speed, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for average travel speed, Ld	-	mi
Adj. factor for the effect of passing lane on average speed, fpl	-	
Average travel speed including passing lane, ATSpl	-	
Percent free flow speed including passing lane, PFFSpl	0.0	%

-----Percent Time-Spent-Following with Passing Lane-----

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

-----Level of Service and Other Performance Measures with Passing Lane-----

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	800.0
Effective width of outside lane, We	24.00
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	3.00
Bicycle LOS	C

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

Heavy-vehicle adjustment factor, fHV	1.000	1.000	
Grade adjustment factor, (note-1) fg	1.00	1.00	
Directional flow rate, (note-2) vi	993	588	pc/h
Base percent time-spent-following, (note-4) BPTSFD	73.4	%	
Adjustment for no-passing zones, fnp	23.1		
Percent time-spent-following, PTSFD	87.9	%	

-----Level of Service and Other Performance Measures-----

Level of service, LOS	D	
Volume to capacity ratio, v/c	0.58	
Peak 15-min vehicle-miles of travel, VMT15	50	veh-mi
Peak-hour vehicle-miles of travel, VMT60	183	veh-mi
Peak 15-min total travel time, TT15	1.2	veh-h
Capacity from ATS, CdATS	1695	veh/h
Capacity from PTSF, CdPTSF	1700	veh/h
Directional Capacity	1695	veh/h

-----Passing Lane Analysis-----

Total length of analysis segment, Lt	0.2	mi
Length of two-lane highway upstream of the passing lane, Lu	-	mi
Length of passing lane including tapers, Lpl	-	mi
Average travel speed, ATSD (from above)	40.8	mi/h
Percent time-spent-following, PTSFD (from above)	87.9	
Level of service, LOSd (from above)	D	

-----Average Travel Speed with Passing Lane-----

Downstream length of two-lane highway within effective length of passing lane for average travel speed, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for average travel speed, Ld	-	mi
Adj. factor for the effect of passing lane on average speed, fpl	-	
Average travel speed including passing lane, ATSpl	-	
Percent free flow speed including passing lane, PFFSpl	0.0	%

-----Percent Time-Spent-Following with Passing Lane-----

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

-----Level of Service and Other Performance Measures with Passing Lane-----

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	993.5
Effective width of outside lane, We	24.00
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	3.11
Bicycle LOS	C

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.

HCS7 Multi Lane Highway Segments Text Report

MULTI LANE HIGHWAY SEGMENT ANALYSIS

File Name: 2020_FRI_Bonnyvi ew.xuf
 Analyst: Kimley-Horn
 Agency:
 Jurisdiction:
 Date: 5/23/18
 Analysis Year: Opening Year (2025) plus Project (1A)
 Time Period Analyzed: Friday PM Peak-Hour
 Project Description: Bonnyvi ew Road, w/o Bechelli Lane
 Units: U.S. Customary

Direction 1: EB

LOS and Performance Measures

Flow rate, v_p	1530	pc/h/ln
Capacity, C	3800	pc/h/ln
Speed, S	44.1	mi/h
Density, D	17.3	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	3	ft
Median Type	Divided	
Access Point Density	0.0	access points/mi
Demand Volume, V	1367	veh/h
Peak Hour Factor, PHF	0.92	
Percent Total Trucks	3.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	45.0	mi/h
Lane width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance, LCR	6	ft
Left-Side Lateral Clearance, LCL	3	ft
Total Lateral Clearance, TLC	9.00	ft
Total Lateral Clearance Adjustment, fTLC	0.9	mi/h
Median Type	Divided	
Median Type Adjustment, fM	0.0	mi/h
Access Point Density	0.0	access points/mi
Access Point Density Adjustment, fA	0.0	mi/h

Heavy-vehicle adjustment factor, fHV	1.000	1.000	
Grade adjustment factor,(note-1) fg	1.00	1.00	
Directional flow rate,(note-2) vi	447 pc/h	611	pc/h
Base percent time-spent-following,(note-4) BPTSFD	49.3	%	
Adjustment for no-passing zones, fnp	36.1		
Percent time-spent-following, PTSFD	64.6	%	

-----Level of Service and Other Performance Measures-----

Level of service, LOS	C	
Volume to capacity ratio, v/c	0.27	
Peak 15-min vehicle-miles of travel, VMT15	22	veh-mi
Peak-hour vehicle-miles of travel, VMT60	82	veh-mi
Peak 15-min total travel time, TT15	0.5	veh-h
Capacity from ATS, CdATS	1695	veh/h
Capacity from PTSF, CdPTSF	1700	veh/h
Directional Capacity	1695	veh/h

-----Passing Lane Analysis-----

Total length of analysis segment, Lt	0.2	mi
Length of two-lane highway upstream of the passing lane, Lu	-	mi
Length of passing lane including tapers, Lpl	-	mi
Average travel speed, ATSD (from above)	44.9	mi/h
Percent time-spent-following, PTSFD (from above)	64.6	
Level of service, LOSd (from above)	C	

-----Average Travel Speed with Passing Lane-----

Downstream length of two-lane highway within effective length of passing lane for average travel speed, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for average travel speed, Ld	-	mi
Adj. factor for the effect of passing lane on average speed, fpl	-	
Average travel speed including passing lane, ATSpl	-	
Percent free flow speed including passing lane, PFFSpl	0.0	%

-----Percent Time-Spent-Following with Passing Lane-----

Downstream length of two-lane highway within effective length of passing lane for percent time-spent-following, Lde	-	mi
Length of two-lane highway downstream of effective length of the passing lane for percent time-spent-following, Ld	-	mi
Adj. factor for the effect of passing lane on percent time-spent-following, fpl	-	
Percent time-spent-following including passing lane, PTSFpl	-	%

-----Level of Service and Other Performance Measures with Passing Lane-----

Level of service including passing lane, LOSpl	E	
Peak 15-min total travel time, TT15	-	veh-h

-----Bicycle Level of Service-----

Posted speed limit, Sp	55
Percent of segment with occupied on-highway parking	0
Pavement rating, P	3
Flow rate in outside lane, vOL	446.7
Effective width of outside lane, We	24.00
Effective speed factor, St	4.79
Bicycle LOS Score, BLOS	2.70
Bicycle LOS	C

Notes:

1. Note that the adjustment factor for level terrain is 1.00, as level terrain is one of the base conditions. For the purpose of grade adjustment, specific downgrade segments are treated as level terrain.
2. If v_i (v_d or v_o) $\geq 1,700$ pc/h, terminate analysis-the LOS is F.
3. For the analysis direction only and for $v > 200$ veh/h.
4. For the analysis direction only.
5. Use alternative Exhibit 15-14 if some trucks operate at crawl speeds on a specific downgrade.
